SOLAR ENERGY ~ THE GREAT ADVENTURE

Small scale decentralized energy solutions are happening in communities here and now across the country. Eight different urban and rural integrated solar, wind and biomass solutions are highlighted, developed by people who refuse to wait around for packaged energy solutions.

ENERGY, NEW SOURCES

Briefly surveys potential sources of energy not widely discussed--wind, tides, burning of trash, methane generation and ocean thermal gradients--then focuses on the possibilities of geothermal, fusion, and solar energy. Critical of government and industry energy policies, which have neglected these sources in favor of nuclear power.
