0i₂zzz

00000	Up to the turning point indicated by the first $QL_aL_aL_aL_a$ which appears between the index numbers at the beginning of the message
01QL _a L _a	Up to latitude L_aL_a
02QL _a L _a	Up to longitude L_aL_a
03iii	Up to station iii
04nnn	Up to a point at a distance of nnn kilometers from preceding point
050ZZ	For the area indicated in 5° zone numbers
06QL _a L _a	At latitude L_aL_a
07QL _a L _a	At longitude L_aL_a
08iii	At station iii
09nnn	At a point at a distance of nnn kilometers from preceding point

} ROFOR and PPORO only

Code 1864

i_3 — Supplementary phenomena indicator	
nnn — Specifications related to supplementary phenomena	
$9i_3nnn$	
$90DPwHw$	Direction, period and height of waves. Note.—This group can only be used in TAFOR messages for water airports
$91P_2P_2P_2$	Forecast lowest mean sea pressure (FM 53.B, FM 54.B, FM 55.B, FM 56.C, FM 57.C, FM 58.C) or forecast lowest QNH (FM 51.C, FM 52.C) in whole millibars during the period
$92F,L_oL_o$	Type of front and its position (track of aircraft approximately N-S)
$93F,L_oL_o$	Type of front and its position (track of aircraft approximately E-W)
$94F,GG$	Type of front and time of passage
$951//$	Gradual change along the route
$952L_oL_o$	Rapid change at latitude L_oL_o North along the route
$953L_oL_o$	Rapid change at latitude L_oL_o South along the route
$954L_oL_o$	Rapid change at longitude L_oL_o East along the route
$955L_oL_o$	Rapid change at longitude L_oL_o West along the route
$96GGG_p$	Change beginning at GG and continuing throughout the period indicated by G_p
$97GGG_p$	Temporary variation at GG (when $G_p = 0$) or temporary variations taking place within the period indicated by G_p (when $G_p = 1$ to 9)
$98GGG_p$	Intermittent variations taking place within the period indicated by G_p
$999C_2$	Probability C_2 indicated in tens of per cent.; C_2 cannot exceed 5 = 50 per cent. (if the probability of occurrence of an element exceeds 50 per cent, then that occurrence should be the predominant feature of the forecast) Note: Local variations in ARFOR, ROFOR, FIFOR, PROAR, PRORO and PROFI may be described, if necessary, by the following expressions: LOC—locally (LOC when used, will always be accompanied by plain language sufficient to identify the locality in which the phenomenon is expected) LAN—inland COT—at the coast MAR—at sea VAL—in valleys CIT—near or over large towns MON—above high ground or mountains SCT—scattered (SCT is used when the phenomenon is expected to be scattered in space or time or in both)

* In ROFOR and PRORO such a change group must be qualified by a change group relative to time. In FIFOR and PROFI this group does not need to be qualified by a change group relative to time.

Including N. M. 3/64
Jan. 18, 1964

(Chg 1)

Plain language alternative terminology for the group $9i_3nnn$

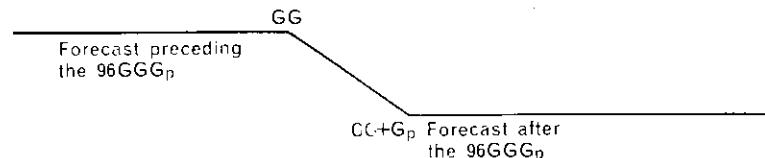

$90DPwHw$	The direction, period and height of waves should be given in plain language: e.g., "WAVES FROM NE FIVE TO SEVEN SECONDS TWO METERS (SIX AND ONE-HALF FEET)"
$91P_2P_2P_2$	(i) Forecast lowest OFF; e.g., "Forecast QNF 10020" in ARFOR, ROFOR, FIFOR, PPOAR, PRORO and PROFI. (ii) Forecast lowest QNH; e.g., "Forecast QNH 10020" in TAFOR and TAF.
	Note: In the plain language alternative the figure for tenths of mb shall always be included in the form of a zero to avoid confusion with the accepted definition of OFF and QNH which are always expressed in tenths of mb.
$92F,L_oL_o$	The term FRONT should be used; the type is not normally designated; e.g., "FRONT 40 N"
$93F,L_oL_o$	The term FRONT should be used; the type is not normally designated; e.g., "FRONT 30 E"
$94F,GG$	The term FRONT should be used; the type is not normally designated; e.g., "FRONT 1200 GMT"
$951//$	The term GRADU (without the time group) should be used for this type of change
$952L_oL_o$	The form RAPID L_oL_oN should be used for this type of change where L_oL_o indicates the latitude (North) at which the change takes place
$953L_oL_o$	The form RAPID L_oL_oS should be used for this type of change where L_oL_o indicates the latitude (South) at which the change takes place
$954L_oL_o$	The form RAPID L_oL_oE should be used for this type of change where L_oL_o indicates the longitude (East) at which the change takes place
$955L_oL_o$	The form RAPID L_oL_oW should be used for this type of change where L_oL_o indicates the longitude (West) at which the change takes place
$96GGG_p$	The form GRADU GGG_eG_e should be used for this type of change, where G_eG_e denotes the end of the period throughout which the change will extend; e.g., "GRADU 0204" indicates a gradual change between 0200 and 0400 GMT; if the period GG to G_eG_e is one hour or less, the term RAPID may be used in place of GRADU
$97GGG_p$	The form TEMP GGG_eG_e should be used for this type of change, where G_eG_e denotes the end of the period throughout which the temporary change(s) may occur, e.g., "TEMPO 1521" indicates a temporary change (or changes) between 1500 and 2100 GMT
$98GGG_p$	The form INTER GGG_eG_e should be used for this type of change, where G_eG_e denotes the end of the period throughout which the intermittent changes will occur; e.g., "INTER 0913" indicates intermittent changes between 0900 and 1300 GMT
$9999C_2$	The form PROB (per cent) should be used for this group; e.g., "PROB 20"

Note: The "Instructions for the group $9i_3nnn$ " appearing as Note (7) under the TAFOR code form apply equally to the plain language alternatives.

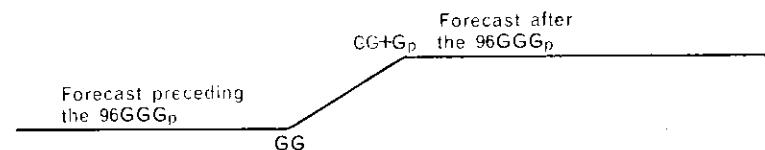

Pictorial illustration of variations (with time as abscissa and for example with "hh" as ordinate in the diagrams.)

Code 2100

K — Effect of the ice on navigation

**Code
figure**

0	Navigation unobstructed
1	Navigation unobstructed for steamers, difficult for sailing ships
2	Navigation difficult for low powered steamers, closed to sailing ships
3	Navigation possible only for powerful steamers
4	Navigation possible only for steamers constructed to withstand ice pressure
5	Navigation possible with the assistance of ice-breakers
6	Channel open in the solid ice
7	Navigation temporarily closed
8	Navigation closed
9	Navigation conditions unknown (e.g. owing to bad weather)

Code 2200

k — Indicator used to specify the half degrees, if any, to be added to $L_a L_a$ and $L_o L_o$ as given in the group $L_a L_a L_o L_o k$

Code

figure

0	Take $L_a L_a L_o L_o$ as sent	$\left. \begin{array}{l} \text{East longitude } 0^\circ - 99^\circ \\ \text{or} \\ \text{West longitude } 100^\circ - 180^\circ \end{array} \right\}$
1	Add $\frac{1}{2}$ degree to $L_a L_a$	
2	Add $\frac{1}{2}$ degree to $L_o L_o$	
3	Add $\frac{1}{2}$ degree to $L_a L_a$ and $L_o L_o$	
4*	Whole degrees	
5	Take $L_a L_a L_o L_o$ as sent	$\left. \begin{array}{l} \text{West longitude } 0^\circ - 99^\circ \\ \text{or} \\ \text{East longitude } 100^\circ - 180^\circ \end{array} \right\}$
6	Add $\frac{1}{2}$ degree to $L_a L_a$	
7	Add $\frac{1}{2}$ degree to $L_o L_o$	
8	Add $\frac{1}{2}$ degree to $L_a L_a$ and $L_o L_o$	
9*	Whole degrees	

* When $k = 4$ or 9 , the values of $L_a L_a$ and $L_o L_o$ are accurate to the nearest whole degree only; for all other values of k , the accuracy is to the nearest $\frac{1}{2}$ degree.

MMM — Number of Morsden square for the ship's position at the time of observation

(See Chartlet page 80)

NUMBERS OF MARSDEN TEN-DEGREE SQUARES CODE 2590

5-80

(Chg 1)

Including N. M. 3/64
Jan. 18, 1964

Code 2590 continued

ANNEX

Subdivisions of the Morsden ten-degree squares into one-degree squares for the eight octants (Q) of the globe

Note: The number to be coded for UL_aUL_b in the position verifying group $MMUL_aUL_b$ is obtained by combining the second figure for L_a and the second figure for L_b in the reported position ($QL_aL_aL_bL_bL_c$). This number UL_aUL_b is the number of the one-degree subdivision of the Marsden ten-degree square in which the ship is located at the time of observation.

When the ship is on the boundary between two (or four) ten-degree Marsden squares the number to be coded for **MMM** is that of the Marsden ten-degree square in which the one-degree sub-division whose number is UL_n, UL_o , as defined above, corresponds to the ship's position.

When the ship is on the meridian 0° or 180° , as well as on the Equator, the number used for reporting Q shall be taken into account for determining the relevant number of the Marsden ten-degree square.

Examples: (1) For a ship located at 42.3°N and 30.0°W the position is coded as follows:

$$Q = 0, \quad L_a L_a L_a = 423, \quad L_a L_a L_a = 300$$

$UL_{\text{L}}UL_{\text{O}}$ is therefore 20. The ship is on the boundary line between Marsden squares 147 and 148. The relevant scheme of the Annex ($Q = 0$) shows that the one-degree subdivision corresponding to the ship's position would be numbered 29 in Marsden square 147 and 20 in Marsden square 148. MMM is therefore to be coded 148.

(2) For a ship located at 40.0°S and 120.0°E the position is coded as follows:

$$Q = 7, \quad L_a L_a L_a = 400, \quad L_a L_a L_a = 200$$

UL_aUL_b is therefore 00. The ship is on the boundary point between Marsden squares 431, 432, 467 and 468. The relevant scheme of the Annex (Q = 7) shows that the one-degree subdivision corresponding to the ship's position would be 90 in Marsden square 431, 99 in Marsden square 432, 00 in Marsden square 467, and 09 in Marsden square 468. MMM is therefore to be coded 467.

9	90 - 99%

Code 3644

r_m — Type of rocket motor

Code figure	
0	4.5 inch, end burning
1	3.0 inch, internal burning
2	Boosted, 4.5 inch, end burning
3	Boosted, 3.0 inch, internal burning

Code 3700

S — State of sea

Code figure	Descriptive terms	Height*	
		in metres	in feet (approximately)
0	Calm (glossy)	0	0
1	Calm (rippled)	0 - 0.1	0 - 1/3
2	Smooth (wavelets)	0.1 - 0.5	1/3 - 1 2/3
3	Slight	0.5 - 1.25	1 2/3 - 4
4	Moderate	1.25 - 2.5	4 - 8
5	Rough	2.5 - 4	8 - 13
6	Very rough	4 - 6	13 - 20
7	High	6 - 9	20 - 30
8	Very high	9 - 14	30 - 45
9	Phenomenal	over 14	over 45

* The average wave height as obtained from the larger well-formed waves of the wave system being observed.

Note: The exact bounding height is to be assigned for the lower code figure, e.g. a height of 4 metres is coded as 5.

Code 3752

S₁ — Character of tropopause

Code
figure

1	Lapse rate above tropopause Lapse rate below tropopause	$\leq 0^{\circ} \text{C/km}$ } T	
2	Conventional tropopause coincides with a significant change in lapse rate	$\geq 5^{\circ} \text{C/km}$ } T	
3		$> 0^{\circ} \text{C/km}$ } T	
4		$\geq 5^{\circ} \text{C/km}$ } T	
5		$\leq 0^{\circ} \text{C/km}$ } T	
6	Conventional tropopause does not coincide with any significant change in lapse rate	$< 5^{\circ} \text{C/km}$ } T	
7		$> 0^{\circ} \text{C/km}$ } T	
		$< 5^{\circ} \text{C/km}$ } T	
8	but a significant change in lapse rate $> 3^{\circ} \text{C/km}$ occurs at a level above the conventional tropopause	T	
9	but a significant change in lapse rate $> 3^{\circ} \text{C/km}$ occurs at a level below the conventional tropopause	T	
	and no significant change in lapse rate $> 3^{\circ} \text{C/km}$ occurs at any other level	T	
8	Level of tropopause uncertain because top of ascent is less than 2 km above the level which appears to be the tropopause.		
9	Tropopause is not allocated to any of preceding categories.		

Notes:

1. All lapse rates should be determined over 1 km intervals.
2. If the conventional tropopause does not coincide with any significant change in the lapse rate and a change of lapse rate occurs at levels both above and below conventional tropopause, then the larger of these changes should be used to determine whether allocation of type 5 or type 6 is appropriate.
3. When type 6 conventional tropopause is observed in arctic and antarctic regions in winter, the level of marked change in lapse rate below the conventional tropopause should be referred to as an arctic or antarctic tropopause and should be recorded as such in addition to the conventional tropopause, provided that over no interval of 1 km between the conventional and arctic or antarctic tropopause does the lapse rate exceed 3°C/km . In this case the character of the arctic or antarctic tropopause should be given by code figure 9.

Code 3762

**S₁, S₂ — Nature of the zone separated by the line formed by the
points following the 2C_sS₁S₂Z₁ group (S₁ is the part to
the right of the line, S₂ is the zone inside the line)**

Code 3939

T_i — Tropical system intensity when T_t = 0.8

Code figure	Code figure
0	No specification
1	Weak, decreasing
2	Weak, little or no change
3	Weak, increasing
4	Moderate, decreasing

Code 3940

T_i — Tropical system intensity when T_t = 9*

Code figure	Beaufort Scale	Mean speed in knots	Mean speed in m/s	Mean speed in km/h
0	Force 10	48 - 55	24.5 - 28.4	89 - 102
1	11	56 - 63	28.5 - 32.6	103 - 117
2	12	64 - 71	32.7 - 36.9	118 - 133
3	12	72 - 80	37.0 - 41.4	134 - 149
4	12	81 or over	41.5 or over	150 or over
5	5	17 - 21	8.0 - 10.7	29 - 38
6	6	22 - 27	10.8 - 13.8	39 - 49
7	7	28 - 33	13.9 - 17.1	50 - 61
8	8	34 - 40	17.2 - 20.7	62 - 74
9	9	41 - 47	20.8 - 24.4	75 - 88

* When T_t = 9, the code figure given for T_i indicates the force of the strongest wind in the reported cyclonic circulation or, in the case of a prognosis, the strongest wind force expected at the time of the prognosis.

Code 3952

T_t — Tropical circulation type

Code figure	Code figure
0	Intertropical convergence zone
1	Shear line
2	Line or zone of convergence
3	Axis of doldrum belt
4	Trough in westerlies
5	Trough in easterlies
6	LOW area
7	Surge line
8	Line or zone of divergence
9	Tropical cyclonic circulation

Code 3956

T_x — Maximum air temperatureT_n — Minimum air temperature

Code figure	Temperature in degrees Celsius	Code figure	Temperature in degrees Celsius
0	Less than - 10	5	5 to 10
1	- 10 to - 5	6	10 to 20
2	- 5 to - 1	7	20 to 30
3	About 0 (to nearly \pm 1)	8	Greater than 30
4	1 to 5	9	Temperature not forecasted

Code 3957

T_{x_0} — Approximate tenths value of air temperature and dew point temperature at surface
 T_{x_1}
 T_{x_2}
 \dots
 T_{x_n} — Approximate tenths value of air temperature and dew point temperature at levels specified by $P_1P_1, P_2P_2, \dots P_nP_n$, or at selected levels

Code figure	Tenths of TT	Tenths of T_dT_d	Code figure	Tenths of TT	Tenths of T_dT_d
0	0	0	5	4,5,6	4,5,6
1	1,2,3	1,2,3	6	4,5,6	7,8,9
2	1,2,3	4,5,6	7	7,8,9	1,2,3
3	1,2,3	7,8,9	8	7,8,9	4,5,6
4	4,5,6	1,2,3	9	7,8,9	7,8,9

Notes:

- 1) In decoding the code figure reported, the middle value of tenths is taken; e.g. if $T_{x_0} = 6$, the tenths of TT are taken as 5 and the tenths of T_dT_d are taken as 8.
- 2) If tenths of either TT or T_dT_d (but not both) are zero, this zero value is treated as if it were one tenth.

Code 4013

t_L — Thickness of layer

Code 4377 continued

Notes:

- 1) The code is direct reading in units of 100 m (approx. 110 yards or 1/16 statute mile) from 0 to 50.
- 2) The code figures 51 to 55 are not used.
- 3) For code figures 56 to 80, 50 is subtracted and the remaining figure is direct reading in units of km (approx. 1,100 yards or 5/8 statute mile).
- 4) For code figures 81 to 89, the code reads in increments of 5 km (3 1/8 statute miles) from the values given for code figure 80.
- 5) The code table is to be considered as a coding device in which certain code figures are assigned values. These are discrete values (not ranges). Any observation or forecast of values to be coded in the code table is to be made without regard to the code table. The coding is then accomplished according to the following rule: If the observed or forecast visibility is between two of the reportable distances as given in the table, the code figure for the lower reportable distance is reported.
- 6) Only code figures 00-89 shall be used for aeronautical purposes at land stations.

Code 4451

V_s — Ship's average speed made good during the three hours preceding the time of observation

Code

figure

0	0 nautical mile per hour	0 kilometer per hour

W_sW_s — Significant weather

Code figure	Code figure
00 Area of heavy swell	55 Area of gales (8 Beaufort or more)
11 Area of strong winds (6 and 7 Beaufort)	66 Area of continuous precipitation
22 Area of medium cloud	77 Area of squally weather
33 Area of low cloud	88 Area of heavy showers
44 Area of poor visibility	99 Area of thunderstorms

Code 4687

W₁W₁ — Forecast weather at surface (to be used in aeronautical forecast codes)

Code figure	Code figure
00 No cloud	50 Drizzle, slight, intermittent
01 Clouds dissipating	51 Drizzle, slight, continuous
02 State of sky not changing	52 Drizzle, moderate, intermittent
03 Clouds increasing	53 Drizzle, moderate, continuous
04 Smoke	54 Drizzle, heavy (dense), intermittent
05 Haze	55 Drizzle, heavy (dense), continuous
06 Widespread dust* in suspension	56 Drizzle, slight, freezing
07 Dust/sand raised by wind	57 Drizzle, moderate or heavy (dense), freezing
08 Well developed dust whirls or sand whirls	58 Drizzle and rain, slight
09 —	59 Drizzle and rain, moderate or heavy
10 Mist	60 Rain, slight, intermittent
11 Shallow fog or ice fog (in patches)	61 Rain, slight, continuous
12 Shallow fog or ice fog (continuous)	62 Rain, moderate, intermittent
13 Lightning	63 Rain, moderate, continuous
14 —	64 Rain, heavy, intermittent
15 Precipitation within sight, distant from the station	65 Rain, heavy, continuous
16 Precipitation within sight, near to the station	66 Rain, slight, freezing
17 Thunderstorm, but no precipitation	67 Rain, moderate or heavy, freezing
18 Squall(s)	68 Rain or drizzle and snow, slight
19 Funnel cloud(s)	69 Rain or drizzle and snow, moderate or heavy
20-29 —	70 Snow, slight, intermittent
30 —	71 Snow, slight, continuous
31 Slight or moderate duststorm or sandstorm	72 Snow, moderate, intermittent
32 —	73 Snow, moderate, continuous
33 —	74 Snow, heavy, intermittent
34 Severe duststorm or sandstorm	75 Snow, heavy, continuous
35 —	76 Ice prisms
36 Slight or moderate drifting snow	77 Snow grains
37 Heavy drifting snow	78 —
38 Slight or moderate blowing snow	79 Ice pellets type (a)
39 Heavy blowing snow	80 Rain shower(s), slight
40 Fog or ice fog at distance	81 Rain shower(s), moderate or heavy
41 Fog or ice fog in patches	82 Rain shower(s), violent
42 Fog or ice fog, sky visible	83 Shower(s) of rain and snow, slight
43 Fog or ice fog, sky invisible	84 Shower(s) of rain and snow, moderate or heavy
44 Fog or ice fog, sky visible	85 Snow shower(s), slight
45 Fog or ice fog, sky invisible	86 Snow shower(s), moderate or heavy
46 Fog or ice fog, sky invisible	87 } Shower(s) of snow pellets or ice pellets type (b) with — slight
47 Fog or ice fog, sky invisible	88 } or without rain or rain and snow mixed — moderate or heavy
48 Fog, depositing rime, sky visible	89 } Shower(s) of hail, with or without rain or rain and snow — slight
49 Fog, depositing rime, sky invisible	90 } mixed, not associated with thunder — moderate or heavy
	91 —
	92 —
	93 —
	94 —
	95 Thunderstorm, slight or moderate, with rain or snow
	96 Thunderstorm, slight or moderate, with hail
	97 Thunderstorm, heavy, with rain or snow
	98 Thunderstorm, combined with duststorm or sandstorm
	99 Thunderstorm, heavy, with hail

* Dust haze

BALTIC ICE CODE

This code is used by the following countries: Belgium, Denmark, Federal Republic of Germany, Finland, Norway, Poland, Sweden and USSR.

CODE FORM

The code form is the following:

ICE AA ijkijk ijkijk ijkijk
 BB ijkijk ijkijk ijkijk
 etc.

NOTES: (1) The index letters AA, BB, etc., are included in the message to indicate to which main group of zones the following 3 six-figure groups refer.
 (2) Each main group of zones is composed of 6 zones; information for each zone is given by a triad ijk, so that each six-figure group refers to two zones.
 (3) If the code figures for ijk are the same for all zones of a main group only one triad ijk is included after the index letters of the main group, e.g., CC 502.
 (4) If ice conditions are uniform over all the zones pertaining to several successive main groups only the index letters of the first and last of these main groups are given, followed by the triad ijk depicting the prevailing ice conditions, e.g., DD-HH 000.

TABLE I
(Character of the Ice = i)

0 – No ice.	5 – Winter fast-ice
1 – New ice (ice crystals/frazil crystals, slush/sludge, pancake-ice or ice-rind).	6 – Close pack-ice/close drift-ice.
2 – Young or rotten fast ice.	7 – Very close pack-ice/very close drift-ice.
3 – Very open or open pack-ice/very open or open drift-ice.	8 – Pressure ice-screw/ice or ice-fields, consisting of heavy floes.
4 – A compressed accumulation of slush/sludge or small pancake ice. (A thick layer of ice formed where free drift is obstructed.)	9 – Shore lead. x – No information.

TABLE II
(Ice Development = j)

0 – No change.	6 – Ice freezing together.
1 – Ice situation getting better.	7 – Ice drifting in or pressing together.
2 – Ice situation getting worse.	8 – Warning for pressure ridges.
3 – Ice breaking up.	9 – Warning for hummocking or ice-screwing.
4 – Ice opening or drifting away.	x – No information.
5 – Ice increasing.	

TABLE III
(Effect of the Ice on Navigation = k)

0 – Navigation unobstructed.	5 – Navigation unobstructed in channel in fast-ice previously made by ice-breaker.
1 – Navigation unobstructed for power-driven vessels built of iron and steel, dangerous for wooden vessels without ice-sheathing.	6 – Navigation possible only with assistance of ice-breaker.
2 – Navigation difficult for low-powered vessels without assistance of ice-breaker, dangerous for vessels of weak construction.	7 – Ice-breaker can give assistance only to ships strengthened for navigation in ice.
3 – Navigation possible only for high-powered vessels of strong construction.	8 – Navigation temporarily closed.
4 – Ice-breaker assistance available in case of need.	9 – Navigation closed. x – No information.

Note.—When conditions in all the areas in one or more main groups are the same, the message can be abbreviated thus:
 AA xx8 or CC-RR 000. If there is no report from a main group, the designated letters (AA, BB, etc.) are omitted.

METEOROLOGICAL CODES OF CHINESE PEOPLE'S REPUBLIC

SYNOP

IIiii Nddf_mf_m VVwwW PPPTT N_hC_LhC_mC_h T_dT_do_{pp} (7R₁₂R₁₂T_{e12}T_{e12}) xRR_{T_gT_g} ^{T_eT_e} 8N_sCh_sh_s 9S_pS_ps_ps_p
hhhP₁P₁ 22R₁R₁R₁

NOTES: 1. The SYNOP code is used for 3- and 6-hourly observations.
2. Peiping Standard Time is used in this report except that the observation time of T_gT_g in the xRR_{T_gT_g} group is Local Standard time.
3. Supplementary groups are reported in accordance with the following table:

IIiii	-T _d T _d o _{pp} plus	Z	P	7R ₁₂ R ₁₂ T _{e12} T _{e12}	xRR _{T_gT_g}	8N _s Ch _s h _s	9S _p S _p s _p s _p	hhhP ₁ P ₁	22R ₁ R ₁ R ₁
00 08	"	xRR _{T_gT_g}	1)	"	"	"	"	"	"
03 11				"	"	"	"		
06 14		xRR _{T_eT_e}	2)	"	"	"	"		
09 17				"	"	"	"		
12 20	"	xRRxx		"	"	"	"		
15 23				"	"	"	"		
18 02		xRR _{T_eT_e}	3)	"	"	"	"		
21 05				"	"	"	"		

(1) This group is reported when ground temperature is -5°C to +5°C.

(2) T_eT_e means past 24-hour minimum temperature.

(3) T_eT_e means past 24-hour maximum temperature.

(4) 8N_sCh_sh_s may be repeated to report a number of layers of clouds.

The order of reporting the groups is always from low to high levels.

SYNOP CODE BREAKDOWN

IIiii	- Station index number
N	- The fraction of the celestial dome covered by cloud.
dd	- True direction, in tens of degrees, from which the wind is blowing.
f _m f _m	- Wind speed in meters per second (m/s).
	(1) With an anemometer with a heavy plate, and a wind speed over 40 m/s, 88 is entered for f _m f _m .
VV	- Horizontal visibility in kilometers (k/m).
ww	- Present weather.
W	- Past weather.
PPP	- Pressure in tenths of millibars.
	(1) At stations with elevation of 1,500m or more, PPP in group PPPTT is reported as xxx.
TT	- Air temperature in whole degrees Celsius.
N _h	- Amount of cloud, the height of whose base is reported by h.
C _L	- Clouds of genera Sc, St, Cu, and Cb.
h	- Height above ground, of the base of the cloud.
C _m	- Clouds of genera Ac, As, and Ns.
C _h	- Clouds of genera Ci, Cs, and Cc.
T _d T _d	- Dew point temperature in whole degrees Celsius.
o	- Characteristic of pressure tendency during the three hours preceding the time of observation.
pp	- Amount of pressure tendency during the three hours preceding the time of observation, in tenths of millibars.
R ₁₂ R ₁₂	- Amount of precipitation for the past 24-hours.
T _{e12} T _{e12}	- Extreme temperature in whole degrees Celsius.
	(1) At 0800 PST, the minimum night-time temperature and at 2000 PST, the maximum day-time temperature are given for T _{e12} T _{e12} .

Including N. M. 3/64
Jan. 18, 1964

$T_g T_g$ — Ground temperature in whole degrees Celsius.
 $8N_s C_s h_s$ — Cloud group, height reported in meters (convert to feet).
 $9S_p S_p S_p S_p$ — Special phenomena group.
 hhh — The height of the nearest "constant pressure level" of the station, in whole meters.
 (1) The $hhhP_1P_1$ is used to report the height of the nearest constant pressure level of the station and station pressure.
 (2) At stations with elevation 800m, this group is not reported.
 (3) At stations with elevation 800m to 1,500m, both PPP and hhh (height of 850mb) are reported.
 (4) At stations with elevation 1,500m to 2,300m, the height of 850mb is reported for hhh, in place of PPP.
 (5) At stations with elevation 2,300m to 3,700m, the height of 700mb is reported for hhh, in place of PPP.
 (6) At stations with elevation 3,700m or more, the height of 500mb is reported for hhh, in place of PPP.
 P_1P_1 — Station pressure in whole millibars.
 $22R_1R_1R_1$ — Amount of precipitation for the day in whole millimeters (mm).
 (1) When the amount of precipitation is more than 0.5mm, the $22R_1R_1R_1$ is reported.

6H_zH_zH_zH_z 6d_zd_zf_zf_z S_tH_tH_tT_tT_t

NOTES: 1. The recommended constant pressure surfaces (levels) for which data should be transmitted in Section 1 are the standard reference surfaces for 1,000mb, 850mb, 700mb, 500mb, 400mb, 300mb, 200mb, and 100mb. The code symbol of $h_1h_2h_3$ refers to the geopotential of the 1,000mb surface.
 2. Section 2 significant levels data, the code figure nn - 00 is used to refer to surface data only; the successive levels are numbered 11, 22,, 99, 11, 22, etc.
 3. Only wind data obtained, either by visual or electronic means, from an ascent in which the pressure is observed and from which temperature and other data are computed, should be included in the upper air report; PILOT or wind data obtained by means other than the radiosonde ascent should not be included.
 4. Section 4 is used to report visual observations of clouds, precipitation, turbulence, icing and fog, made during aerometeorograph soundings. The groups may be repeated as many times as required. If a particular element is not observed at any time during the ascent, the particular group and the data group are omitted.
 5. Section 5 is used to report thickness data and thermal wind data.
 6. Section 6 is used to report maximum wind data and tropopause data above 5,000m MSL.
 7. Code figure 99 is reported for missing air temperature and dew point.
 8. Missing data for other elements are reported by the appropriate number of X's.

TEMP CODE BREAKDOWN

IIiii – Station index number
 GG – Actual time of observation to the nearest quarter hour GMT.
 (I) HH+08 – HH+22: GG+25
 HH+23 – HH+37: GG+50
 HH+38 – HH+52: GG+75
 Section 1 – See International Code.
 Section 2 – See International Code.
 Section 3 – See International Code.
 22288 – Cloud information follows.
 K – Number of clouds layers penetrated by the aircraft.
 N₁ – N₉ – Amount of cloud on each layer.
 (1) The order of reporting the cloud layer is always from low to high levels.
 99 – Indicator for cloud information above aircraft follows.
 N_z – Amount of cloud in tenths in each layer.
 C_z – Type of cloud not reached by the aircraft.
 88 – Indicator for cloud information of type of cumulus-system cloud near the aircraft follows.
 C_c – C_c Specification
 1. Cumulus
 2. Cumulus congestus
 3. Cumulonimbus
 H_cH_c – Height of the top of the cloud reported by C_c, in kilometers.
 70 – Indicator for information follows on thickness between 700mb – 1,000mb.
 50 – Indicator for information follows on thickness between 500mb – 1,000mb.
 35 – Indicator for information follows on thickness between 300mb – 500mb.
 hhh – Thickness in tens of meters.
 1 – Indicator for thermal wind data between 700mb and at 1,000mb.
 2 – Indicator for thermal wind data between 500mb and at 1,000mb.
 3 – Indicator for thermal wind data between 300mb and at 500mb.
 d_td_t – Thermal wind direction in tens of degrees.
 f_tf_t – Thermal wind speed in meters per second.
 (1) At stations with elevation 1,000m to 1,500m MSL, the 2d_td_tf_tf_t thermal wind data between 2,000m to 5,500m will be reported.
 (2) At stations with elevation 1,500m or more, the 2d_td_tf_tf_t group is omitted.

NOTES:

- Groups in parentheses are optional data which may or may not be included in the report depending on specified conditions.
- If a particular element is not observed, the indicator group and the data group are omitted from the report.
- Section 1 is used to report winds at successive levels.
- Section 2 (selected levels) is used to indicate wind data, if available, for the levels of either 1,500, 3,000, 5,500, 7,000, 9,000, 12,000, and 16,000 meters (when _{i_h} equals 0-3 or 5-8) or 1,500, 3,000, 5,400, 7,200, 9,000, 12,000, and 15,900 meters (when _{i_h} equals 4 or 9). These altitudes approximate the standard pressure levels of 850, 700, 500, 400, 300, 200, and 100 millibars, respectively.
- Section 3 is used to report thermal wind data.
- Section 4 is used to report significant wind direction shifts and speed changes.
- Section 5 is used only when the wind speed exceeds 30 meters per second (60 knots) at some level above the 500mb level.

PILOT CODE BREAKDOWN

IIIII - Station index number.
GG - Actual time of observation to the nearest quarter hour GMT.
(See: TEMP GG, attachment B.)
_{i_h} - Interval indicator up to 1,000m MSL.
_{i_h}
0 - No supplementary group
1 - One supplementary group
2 - Two supplementary groups
3 - Three supplementary groups
The above code is used for PILOT, RAWIN and RABAL.
D - Surface wind direction.
_{f_a} - Surface wind speed in units of 5 meters per second.
H - Height.

H	Height	H	Height
3	300m above ground	5	5,000m MSL
6	600m above ground	0	10,000m MSL
9	900m above ground	4	14,000m MSL
1	1,000m MSL	8	18,000m MSL
2	2,000m MSL	0	20,000m MSL
x	2,500m MSL	2	22,000m MSL
4	4,000m MSL		Every 2,000m MSL

dd - Wind direction in tens of degrees.
ff - Wind speed in meters per second.
44444 - Indicator group.
8 - Indicator of 850mb data follows.
7 - Indicator for 700mb data follows.
5 - Indicator for 500mb data follows.
4 - Indicator for 400mb data follows.
3 - Indicator for 300mb data follows.
2 - Indicator for 200mb data follows.
1 - Indicator for 100mb data follows.

88888 - Indicator group.
1 - Indicator for thermal wind data between 700mb and at 1,000mb.
2 - Indicator for thermal wind data between 500mb and at 1,000mb.
3 - Indicator for thermal wind data between 300mb and at 500mb.
 $d_t d_t$ - Thermal wind direction in tens of degrees.
 $f_t f_t$ - Thermal wind speed in meters per second.
 (1) At stations with elevation 1,000m to 1,500m MSL, the $2d_t d_t f_t f_t$ group, thermal wind data between 2,000m to 5,500m will be reported.
 (2) At stations with elevation 1,500m or more, the $2d_t d_t f_t f_t$ group is omitted.
 (3) If a RABAL observation is taken, the thermal wind data between 1,000mb - 700mb, 1,000 - 500mb and 500mb - 300mb will be reported.
55555 - Indicator group.
 $H_z H_z H_z H_z$ - Altitude of significant point of the wind, in geopotential meters.
Z - Character of the change of the wind in the vertical at the significant point.
 (1) $H_z H_z H_z H_z Z$ is reported when:
 (a) Wind speed changes 5 m/s or more, within 500m layer.
 (b) Wind shifts 30° or more, within 500m layer.
 (2) $H_z H_z H_z H_z Z$ group should be reported 3 groups or less.
11111 - Indicator group.
6 - Indicator for maximum wind data follows.
 $d_z d_z$ - Maximum wind direction in tens of degrees.
 $f_z f_z$ - Maximum wind speed in meters per second.

PILOT SHIP

NOTES:

1. This code form is known as the International Analysis Code (IAC).
2. Notes pertaining to this International Analysis Code can be found under World Meteorological Organization (WMO) FM Code 45.
3. The 99977 group is used by the CPR as follows:
 - 88 - Indicator
 - uuu - Value of isopleth in millimeters (mm).
 - (a) This section will only be included during the period from 1 May to 30 September.
 - (b) In the 00z Surface analysis chart, this section will report the forecast 24 hour rainfall amount ending at 00z next day. The whole section will be omitted if no rain is expected.
 - (c) If there should be major change in the forecast, this section will be inserted in the 06z analysis chart again with the same period of validity i.e., 00z. This section will not appear in the 06z analysis if no correction is required.
 - (d) This section will not appear in the other analysis charts.
 - (e) Since isobars are analyzed for each 2.5 mbs in our Service, code figures 002, 007, etc., will respectively represent the isobaric values 1002.5, 1007.5, etc.
 - (f) In the upper air analysis, contour lines will be reported in geopotential decameters.

INFORMATION DATED: 1 April 1957

5. Plain language remarks may be added at the end of the message to supplement the coded message or to supply additional information not provided for in the code.

6. The solidus (/) will be used to report missing or unknown data unless otherwise specified for the individual elements. The term "altitude" is defined as the vertical distance of a level point or an object considered as a point, measured from mean sea level.

7. If operational data or position reports are required, they will be transmitted by the aircraft prior to the 9xxx9 key group of the RECCO report. These additional operational reports will not be included in the landline teletypewriter transmission of the RECCO report.

SECTION 1 - MANDATORY Section of the Flight Level Portion of the Message

8. 9xxx9 - The key group 9xxx9 indicates the dimensional unit being used and whether or not radar observations are being made. This group shall always be included in the report. If radar equipment is operational, this information shall be reported for symbol "xxx" even though no echoes are observed. The omission of the 8-groups from the report will indicate to the recipient that no echoes were observed.

(Note: The units indicated by symbol "xxx" apply only to the flight level portions of the message. All altitudes of standard pressure surfaces and tropopause reported in the sounding portion of the message are given in meters and decameters in accord with the instructions given in the Manual for Radiosonde Code for reporting sounding data.)

9. GGgg and Y - The time the aircraft is on the vertical axis of the observation cylinder is reported for "GGgg". All elements are observed, insofar as practicable, when the aircraft is at the point of observation or in proximity thereto. The actual time of observation is the time at which the observing of all elements is completed. All times (GGgg) and the day of the week (Y) are given in Greenwich Mean Time. The day reported for Y is the day on which the observation is taken and NOT the day on which it is transmitted.

10. $L_{01}L_{02}L_{03}L_{04}L_{05}$ - The latitude and longitude of the point, at which the flight level observation is made, are reported for "L₀₁L₀₂L₀₃L₀₄L₀₅", respectively. Tenths of a degree are obtained by dividing the number of minutes by 6, disregarding the remainder. The hundredths digit is omitted from longitudes 100° to 180°, inclusive.

11. B - The type of turbulence encountered at the time of observation is reported for "B". Definitions of the terms used to indicate the various types of turbulence reported are:

Light - A turbulent condition during which occupants may be required to use seat belts, but objects in the aircraft remain at rest.

Moderate - A turbulent condition in which occupants require seat belts and occasionally are thrown against the belt. Unsecured objects in the aircraft move about.

Severe - A turbulent condition in which the aircraft momentarily may be out of control. Occupants are thrown violently against the belt and back into the seat. Objects not secured in the aircraft are tossed about.

12. f_1^* - The average flight condition existing during the time required to make the flight level observation is reported for "f₁".

13. hhh - The true altitude of the aircraft at the time of the flight level observation is reported to the nearest hundred foot or 30 meter level (e.g., when the aircraft is 50 feet or more above a hundred foot level the next higher level is reported for "hhn").

14. d_1 - When code figure 9 is reported, the distance over which the wind is averaged is added at the end of the message in plain language.

15. d_2 and dffff - When code figure 8 is reported for "d₂", five solids (i.e., /////) are reported for the "dffff" group. The complete specifications for Table 7 are:

TABLE 8: d_2

0 90% to 100% reliable. Multiple drift with closed wind star, or small open star when winds are 50 kts or greater. Short radar wind runs.

1 75% to 100% reliable. Multiple drift with small open star or double drift or single drift with average ground speed by timing. Short radar run.

2 80% to 100% reliable. Fix to fix winds using the following pin point visual fixes, radar fixes or accurate loran fixes using good ground waves.

3 75% to 90% reliable. Fix to fix winds using two or three lines of positions (LOPs) either loran, celestial, radio or sight bearings or any combination of the three above when all lines of position are considered reliable.

4 60% to 80% reliable. Winds obtained using single drift and single LOP (Speed Line), air-plot, etc.

5 50% to 75% reliable. Fix to fix winds using two or three lines of position either loran, celestial, radio or sight bearings or any combination of the above when one of the lines is not considered reliable.

6 Less than 50% reliable. Winds obtained by any of the above methods which the navigator believes to be inaccurate or of questionable accuracy.

7 No reliability. Assumed or estimated winds.

8 No wind. Navigator unable to determine a wind.

9 Not used.

16. TT - Free air temperature (corrected for calibration, installation, and dynamic heating effects) at flight level (hhhh) at the time of observation is reported for "TT" to the nearest whole degree Celsius.

When the temperature is below 30°, 50 is added to the absolute value of the temperature and the sum is reported for "TT". The hundreds figure, if any, resulting from this addition is disregarded.

17. TdTd - When the wet bulb temperature is below -35°C, // is reported for "TdTd". The point is used to indicate the moisture content of the air in United States RECCO reports. (See Note 16.)

18. w - The specification most descriptive of the weather existing at the time of observation is reported for "w". Code figure 2 is reported when the total amount of cloud above or below the aircraft is 7/8 or more.

19. m - The information which best amplifies the present weather reported for "w" is reported for "m".

SECTION 2 - OPTIONAL Section of the Flight Level Portion of the Message

20. $l_{01}N_1N_2N_3$ - If data on more than three layers of cloud are reported, a second $l_{01}N_1N_2N_3$ group plus the required number of Chhhh groups are inserted in the message following the last of the first three Chhhh groups. The additional number of layers (i.e., exclusive of the first three layers) being reported is given for " l_{01} " in the second $l_{01}N_1N_2N_3$ group. The coverage of the

additional cloud layers is reported for N_1 , N_2 , and N_3 in the second group, as required. When no clouds exist the $l_{01}N_1N_2N_3$ and Chhhh groups are omitted from the message.

21. k_n - When clouds are present in indefinite layers (chaotic sky) code figure 9 is reported for " k_n ". If it is impossible to determine that clouds exist (due to darkness or for other reasons) a "/" is reported for " k_n ". When a cloud layer is present but data on the type, the extent of coverage, and altitude can not be observed, // is reported for N_1 , C , h_n , and NH , as appropriate; however, the layer will be included in the number of layers reported for " k_n ". (See Note 22.)

22. N_1 , N_2 , N_3 - The amount of cloud reported for N_1 , N_2 , etc., is the amount in the individual layer as though no other cloud were present; i.e., the summation concept is not used. The cloud layers are reported in the message in ascending order according to altitude of the base. When code figure 9 is reported for " N_1 ", the value reported for " N_1 " is the total amount of cloud coverage present and "/" is reported for " N_2N_3 ". When a "/" is reported for " k_n ", "999" is reported for " $N_1N_2N_3$ ". (See Note 21.)

23. Chhhh - This group is included in the message for each layer of clouds reported by " k_n " and described by N_1 , N_2 , etc.

24. C - The type of cloud predominating in the layer is reported for "C".

25. hh and HH - The average altitude of both the base and top of the cloud layer reported for "C" is reported for "hh" and "HH", respectively.

26. 4ffff and 50FSDg - Surface data are reported in this group. Surface wind data are included in each low level report. Either or both of the groups may be included in the message if required.

27. dd - The estimated direction (true) FROM which the surface wind is blowing is reported for "dd". (See Note 28.)

28. ff - The estimated speed of the surface wind is reported for "ff". In the range of 100-199 knots, inclusive, the hundreds figure is omitted and the tens and the units values are reported for "ff" and 50 is added to the value normally reported for "dd". For speeds in excess of 199 knots, // is reported for "ff" and the actual speed is reported in plain language at the end of the message.

29. D - The estimated direction (true) FROM which the surface wind is blowing is reported for "D".

30. F - The estimated force of the surface wind is reported. When the speed exceeds Force 9, code figure 9 is reported for "F" and a plain language remark is added at the end of the flight level portion of the message giving the actual Beaufort Force as "GALE TEN", "STORM ELEVEN", or "HURRICANE TWELVE".

31. D_x - The true direction FROM which the swell is moving is reported for "D_x". Code figure 0 is reported for "no swell" and code figure 9 is reported to indicate "confused" swell. When the waves are from several directions, the direction from which the wave of longest period is traveling is reported.

32. 8Wg₁W₂W₃W₄ - Two 6-groups may be included in the message to report two significant weather changes, and/or two weather phenomena off course, or combinations thereof.

33. W_g - Significant weather changes which have occurred since the last observation, or in the preceding hour (whichever period is shorter) along the track of the aircraft are reported for "W_g".

34. S_g - The distance from the present position back to the location of the significant weather change (W_g) is reported for "S_g".

35. S_1 - Any off-course weather condition of importance which is not included or implied in the specification reported for present weather, will be reported for " S_1 ". The information reported for " S_1 " supplements the present weather (w). (See Notes 2, 18, 54 and 55.)

36. D_g - Code figure 9 indicates "in all directions".

37. 7g₁7g₂7g₃ 7h₁h₂h₃ - When icing occurs, both of the 7-groups shall be included in the report. The 8-groups may be repeated as often as necessary to describe the icing conditions encountered.

38. T_f - Normally only aircraft equipped with icing rate meters will report code figures 0 through 6; however, if a quantitative estimate is possible it may be reported even though the aircraft equipment does not include a meter. In general, code figures 7 through 9 are used more often than the other code figures.

United States definitions of the terms given in Table 21 used to describe the rate of ice accumulation are:

Light - An accumulation of ice which can be disposed of by the aircraft de-icing equipment, which presents no serious hazard to the flight, and which is not sufficient to cause alterations in speed, altitude, or track.

Moderate - An accumulation of ice which produces a condition intermediate between "light" and "heavy".

Heavy - An accumulation of ice which continues to increase despite operation of de-icing equipment, which is sufficiently serious to cause marked alteration in speed, altitude, or track, and which would seriously affect the safety of the aircraft.

39. I₁ - For this purpose a non-persistent control is defined as one which is 1/6 nautical mile or less in length and a persistent control is one which is over 1/4 nautical mile in length.

40. S_b - Code figure 0 is reported when the aircraft has completed an ascent or a descent, in which case the limits of icing are reported in group 7h₁h₂h₃. Code figure 2 is reported when the icing began during the time of the flight level observation and it will be an amplification of the information reported for "w" and "w'".

41. S_g - Code figure 2 is reported when the icing is continuing at the time of the flight level observation.

42. h₁h₂ - When the aircraft encounters icing during an ascent or descent, the altitude of the base of the icing stratum is reported for "h₁h₂". When the aircraft encounters icing during level flight, the altitude at which icing occurred is reported for "h₁h₂".

43. H₁H₂ - When the aircraft encounters icing during an ascent or descent the altitude of the top of the icing stratum is reported for "H₁H₂". When the aircraft encounters icing during level flight, // is reported for "H₁H₂".

44. 8d₁d₂S₀, 8w₁w₂ - When radar data are observed, both the 8-groups shall be included in the report. The 8-groups may be repeated as often as necessary to report essential data.

45. d_{dr} - Code figure 99 is reported to indicate echoes "in all directions". (See Notes 8 and 44.)

46. S_r - When the distance to the center of the echo is greater than 95 nautical miles, 100 is subtracted from the distance and the tens value of the remainder is reported for "S_r" and 50 is added to the value normally reported for "d_{dr}". When a line of echoes is observed, "S_r" is the distance to the midpoint of the line.

47. C_g - The term solid is used when the individual echoes are not distinctly and widely separated. Code figures 1, 2, 5, and 6 are used to report circular areas of echoes.

SECTION 3 - Intermediate Reports (OPTIONAL)

48. When required, intermediate observations may be taken between complete flight level observations. The intermediate data are reported in the next complete flight level message by inserting the coded groups (i.e., Section 3) in the message immediately following the last coded group of the complete flight level report. Section 3 may be attached at the end of either Section 2 or Section 1, as appropriate.

49. The use of Section 3 is OPTIONAL. If this Section is reported, all of the data groups (i.e., GGgg₁ through mJHHH) shall be always included in the message for each intermediate observation being reported with appropriate missing indicators being used for those elements for which datum is not available except the (4L₁L₂L₃) group. The self-identifying 4-group may be included or omitted as required.

50. The intermediate data groups are extracted from the complete flight level form 71717 precedes the coded sounding data (FM 36.0). In this instance two minor alterations are made in FM 36.0. The M₁M₂ group is omitted from the report and GG is reported to the nearest quarter hour. The nearest quarter of an hour is indicated by adding 25, 50 or 75 to the actual number of hours.

51. Unless otherwise indicated it shall be assumed that a straight-line constant-altitude flight has been made between the position of the last reported complete flight level observation and the present one. Any intermediate observations reported in the present complete flight level report shall be assumed to have been made on this flight path.

52. If the direction of the flight has been altered, the latitude and longitude of the turning point shall be reported by the group (4L₁L₂L₃). The group (4L₁L₂L₃) shall be inserted in the Intermediate Reports portion of the message, as appropriate, with respect to time.

53. If the altitude of the flight is altered between any two consecutive complete flight level observations, intermediate observations shall not be reported between those two flight level reporting positions.

Plain Language Remarks

54. Plain language remarks may be added at the end of the message to supplement the coded data or to supply additional information of importance not provided for in the code. For example: Time of occurrence of significant weather (W_g), past weather, etc.

55. If information on past weather is added as a plain language remark, the most significant weather encountered since the last report, or in the last hour, whichever period of time is shorter, shall be described by the remark.

Bounding Portion of the Message

56. Sounding data are obtained during vertical ascents or descents of the aircraft or by releasing drop-sondes from the aircraft. For transmission purposes these data may be added to Section 2 of RECCO or sent as a separate message.

57. Vertical ascent or descent. WMO code form FM 35.C (TEMP) shall be used to report sounding data obtained by means of either a vertical ascent or descent.

58. If the sounding data are added to the flight level report, they shall be added to Section 2 of RECCO and identified by the indicator group 7171. In this instance the groups M₁M₂ and (M₁M₂) shall be omitted from FM 35.C and the group GChhhhh shall become 00B1h1h1. The form being: 0Wg₁W₂W₃ 17171 00h1h1h1 (T1T2T3T4T5) (0d₁d₂d₃) P2P2h2h2h2 etc.

In this instance the time and position of the ascent or descent shall be given in group GGgg₁ Y0L₁L₂L₃ L0L₁L₂L₃ of the flight level report.

59. When the data obtained by means of a vertical ascent or descent are sent as a separate report, the first four groups of Section 2 of RECCO shall be followed by FM 35.C as follows: 9xxx9 GGgg₁ Y0L₁L₂L₃ L0L₁L₂L₃ 17171 etc.

60. Dropsonde. Sounding data obtained from a drop-sonde released from the aircraft shall be reported by means of WMO code form FM 36.C (TEMP SHIP). The drop-sonde data may be added either to the flight level report or sent as a separate report.

61. When the drop-sonde data are added to Section 2 of RECCO the indicator group 71717 precedes the coded sounding data (FM 36.0). In this instance two minor alterations are made in FM 36.0. The M₁M₂ group is omitted from the report and GG is reported to the nearest quarter hour. The nearest quarter of an hour is indicated by adding 25, 50 or 75 to the actual number of hours.

When the minute lies between 52 1/2 and 07 1/2 minutes, nothing is added to the hour; e.g., times between 0152 1/2 to 0207 1/2 are coded 02. When the minute lies between 07 1/2 and 22 1/2 minutes, 25 is added to the hour; e.g., times between 0307 1/2 to 0322 1/2 are coded 28. When the minute lies between 22 1/2 and 37 1/2 minutes 50 is added to the hour; e.g., times between 1122 1/2 to 1137 1/2 are coded 61. When the minute lies between 37 1/2 to 52 1/2 minutes 75 is added to the hour; e.g., times between 2037 1/2 to 2052 1/2 are coded 95.

62. When the drop-sonde data are sent as a separate report, the TEMP SKIP form of message (FM 36.C) is preceded by the key groups 9xxx9 and 71717.

63. The location and time (to the nearest quarter hour) at which the drop-sonde was ejected from the aircraft shall be given in the Y0L₁L₂L₃ and L0L₁L₂L₃ groups of TEMP SHIP (FM 36.C).

64. Following are general notes which apply to the coding of sounding data obtained by aircraft:

a. Whenever practicable extrapolated data are reported for P₀P₁P₂, T₀T₁T₂ and D₀D₁D₂. If extrapolated data are not available for these elements, the surface groups are omitted from the report.

b. If tenth values of air and dew point temperatures are not reported, a zero is coded for T₀, T₁, T₂, etc.

Sea Ice Data

Sea ice, as observed by aircraft, are reported in the national code form (see Chapter III, Part A-4-RECCO).
