PART I. INTRODUCTION

1. General information.

Model: 2B24

Manufactured by: Singer Simulation Products Division,
The Singer Company, Silver Springs, Maryland

Prototype Cost: \$4.5 Million

Production Model Cost: \$2.3 - 3 Million

Prototype Delivered: December 1970

Future model's expected delivery date: March 1974

Functions: Helicopter instrument simulation and cockpit/emergency procedures

2. Characteristics.

- a. Sound and motion simulation.
- b. Flight control response through 5 degrees of motion.
- c. Three digital computers.
- d. 98 radio and navigation aids.
- e. Turbulence levels through light, moderate, and severe.
- f. Winds to 99 knots.

- g. Ground track generation for student and instructor pilot.
- h. 5-minute playback of flight to include radio calls.
- i. Freeze capability.
- j. Cockpit seat positions for P-CP-IP.

PART II. SYSTEM FUNCTIONS

3. Radios. All communication radios have a 50-mile range or line-of-sight limitation. FM is usually used by IP's to call console operators and FM range is governed by the line-of-sight limitation of the transmitter, located 3 miles north of the Banks Intersection, which is the center of gaming area. The range of all navigation radios is as published in the IFR supplement—10 degrees right or left of a localizer and 10 degrees above or below an ILS—a reliable signal will not be received.

Displays can be centered on aircraft position, center of gamming area, or navaid on programed approach charts.

5. Parameters. Parameters are factors or conditions constituting simulated flight which may be induced as a quantity or constant whose value varies with the circumstances of its application.

Flight controlled parameters - Those conditions controlled from the cockpit. These conditions measure finite values describing flight. They can be programed for a specific constant or quantity as an initial condition. These program changes are difficult; however, flight parameters can be frozen easily.

Console controlled parameters - These parameters are conditions that can be controlled or changed within limits from the console. These parameters are conditions that the IP can change in coordination with console operators.

PARAMETERS

FLIGHT CONTROLLED PARAMETERS

		<u>SCALE</u>	<u>LIMITS</u>	<u>ALERT</u>	<u>CRASH</u>
1.	ALT Altitude	Feet	0-25,000	-	-
2.	A/S Airspeed	Knots	0-143	110	120
3.	HDG Heading	Degrees	000-359	-	-
4.	RL Roll	Degrees	-	25°	45°
5.	PT Pitch	Degrees	-	10°	20°

		<u>SCALE</u>	<u>LIMITS</u>	<u>ALERT</u>	<u>CRASH</u>
6.	YW Yaw	Ball widths	0-2	.5	-
7.	VV Vertical Velocity	Ft/Min	-	-	-
8.	RT Rate of Turn	Degrees/sec	-	6°/sec	-
9.	TP Torque Pressure	Psi	0-60	40	50
10.	RR Rotor Rpm	Rpm	0-380	-	Below 259; above 341

CONSOLE CONTROLLED PARAMETERS

		<u>SCALE</u>	<u>LIMITS</u>	<u>NOTES</u>

15.	GRWT Gross Weight	Lbs	6800-9600	3

		<u>SCALE</u>	<u>LIMITS</u>	<u>NOTES</u>
16.	BARO Barometric Pressure	In of hg	30.99-28.01	
17.	OAT Outside Air Temp	Degrees	0°-110°	4
18.	WV Wind Velocity	Knots	0-99	
19.	WD Wind Direction	Degrees	000-359	
20.	Turb LVL Turbulence LVL	Level	0-9	5
21.	SND LVL Sound Level	Level	0-7	
22.	RD STC	Not used	Not used	
23.	APU AUX PWR Unit	Yes-No	Batt-APU	

NOTES:

1. The units of measurement is a scale in XY coordinates. The console operator can easily move you to a known location (i. e., DHN VOR, Echo Intersection, etc.) in freeze or while flying. To reposition to any other place in the gaming area, you must tell the console operator the direction and distance from a known point. You can fly outside of the gaming area, but console cannot

"XY" you out of the area. Some NAVAIDS are located outside of the gaming area.

2. At zero pounds, of fuel, the engine will fail.
3. 6800 pounds is minimum gross weight that can be programmed; however, you can burn off 1430 pounds of fuel to reduce weight to the minimum.
4. Air temperature is the temperature at mean sea level in degrees Fahrenheit. The indication in the cockpit will be in degrees centigrade. Standard lapse is applied. Icing will accumulate at temperatures lower than 0 degrees C. (Note: Standard lapse rate 2 degrees C/1000 feet or 3.5 degrees F/1000 degrees.)
5. The turbulence level can be changed from inside the cockpit. There is a hail sound at level 6 and above. To set turbulence from the cockpit, proceed as follows:
 - a. Set right thumb wheel to zero (0).
 - b. Set middle thumb wheel to desired turbulence level (0-9).
 - c. Press MALF button and turbulence will change to new setting.
6. Initial condition set. Standard sequences of commonly used parameters are considered initial conditions used to save time at the start of the flight period.

PART III. MALFUNCTIONS

7. Introduction. There are 104 malfunctions. (See list.) Five malfunctions are the maximum, and must be programed by the console operators. Programed malfunctions may be activated from the console, or may be activated from the cockpit. Activated malfunctions will indicate brighter on CRT. To activate malfunctions from the cockpit, proceed as follows:

- a. Right thumb wheel set to malfunction number in order displayed.
- b. Press MALF button to activate.
- c. Press MALF button again to deactivate.

All malfunctions can be completely disabled except the ones that trip circuit breakers. Circuit breakers must be reset in cockpit after the malfunction is deactivated. As long as the malfunction is activated, the circuit breaker will not reset. Malfunctions can also be programed to activate on time (computer time). Fifteen seconds prior to failure, the CRT will flash failure.

8. Malfunction list.

- 11 RPM Warning
- 12 Fire Warning Light

PART IV. SYSTEM OPERATION

9. Motion system. There are 5 degrees of motion cues—roll, yaw, pitch, lateral, and heave. Motion cues are in relation to control movements; however, if the motion system is not on, the controls will work with appropriate instrument response with the exception of the motion cues. To activate the motion system, you must call console (for safety) for clearance. When you press the motion button, the cockpit will come up on motion. Approximately 30 seconds after cockpit stops moving, one last bump will be felt, and the module will be ready. Motion off light will now go out, and the CRT RDY alert will be brighter. To come off motion, call for clearance. (SAFETY: The console operators insure that there is no one in the pit and assist with the ladder.) Press the motion button, and when the cockpit stops moving, you can get out. (SAFETY: Module will come off motion if any door is opened.)

10. Freeze mode. Press the freeze button; all flight instruments to include the clock and ground track are frozen, regardless of the movement of the flight controls. (Keep movement of controls to a minimum since the sum of all control movements will be induced when you press continue.) All communication and navigation radios will operate normally in the freeze mode. To continue, press continue button.

11. Slow mode. This mode slows reaction of module 50 percent. Example: In slow mode, it will take 2 minutes to climb 500 feet at 500 feet/minute or turn 180 degrees at standard rate, and the groundspeed will be slowed by 50 percent. Slow mode does not affect the clock.

12. Audio alerts. If any flight controlled parameter is exceeded, a prerecorded message will be heard in earphones. Alerts will work in one cockpit or all cockpits.

13. Playbacks. Request from console the instant replay. The instant replay will play back all control movements, instrument indications, motion movements, and radio calls for the last 5 minutes of flight.

14. Audio playback. This capability plays back 15 minutes total transmitting time and includes the audio only.

15. Stored plots. This capability recalls any portion of flight up to the first 105 minutes of flight.

16. Auto copilot. Ask the console operators to activate. Auto copilot can only be deactivated by pressing auto copilot button in cockpit. Auto copilot will hold the heading, air-speed, and altitude that you have when you transfer the controls. Do not use the auto copilot above turbulence level 4.

17. Common audio net. Ask console and all four cockpits can monitor all radio calls to console and have the capability to call each other.

18. GCA console. IP may monitor and control students who are solo by UHF and VHF frequencies only.

19. Crash override. OFF - aircraft will crash, which results in a loud bang through the sound system, and the aircraft will freeze when a crash parameter has been exceeded. To continue flying, the console operators must first place you in crash override on. Then you must press "Cont" to continue flying. After a crash, radios are dead. The only means to

call the console operator is with the instructor call button. ON - if a crash parameter is exceeded, no crash will occur.

20. Instructor call. This capability used to call console when there is no answer to repeated calls. When you push inst call button, a light will come on at the console, and the operator will answer (by-passing all radios) by acknowledging your call through your headset.

21. Hard copy printer. The printer will print every time an alert parameter is exceeded, and record the time you were out of tolerance.

scored. This reflected soft tissue of extensive absence and loss
of bone. This disease can be best seen in radiographic studies of the

extremities. There is loss of bone and soft tissue. Loss of epiphyses, loss
of bone, loss of soft tissue, loss of muscle, loss of tendons and
ligaments and loss of bone. This soft tissue loss is associated with
loss of muscle and loss of tendons. The patient has pain and
difficulty moving the limb.

soft tissue loss is characteristic of T-cell lymphoma. This
is a very soft, edematous tissue. It is associated with extensive tissue loss
and destruction of bone.

PART V. OPERATOR MAINTENANCE

22. Introduction. All instruments, controls, and circuit breakers should operate in the trainer EXACTLY the same as they do in the aircraft. If they do not, write up the discrepancies on the 2408-13 for the cockpit. There are a few exceptions that are noted here.
23. Altitude reset. If the altitude in the cockpit is different from the altitude on CRT and console, proceed as follows:
 - a. Press freeze button.
 - b. Pull the fuel valve circuit breaker.
 - c. RPM INC - DEC switch will move both altimeters together to correct altitude.
 - d. If both altimeters are different, pull the circuit breaker behind the fuel valve. The RPM - INC - DEC switch will then move one altimeter until both match. Reset the circuit breaker and repeat steps b and c.
24. Filter light. This is a light located aft right side of companion way. If it comes on, call maintenance.
25. Cockpit lights. Cockpit lights can be turned on and off by toggle switch located below filter light.
26. Fan switch. The fan switch is located under filter light—three-position toggle switch - High - Low - Off; normally, low is used.

27. Flood light. The flood light is used with closed-circuit TV. Dimmer switch is knob located above pilot's left shoulder next to TV camera.

28. Control loading. When all friction is off, the force trim is off, and the cyclic and collective are released; they should stay in the same position; however, if they move, call maintenance.

29. Computer time. Computer time is time the cockpit has been operated since the last data clear regardless of freeze time.

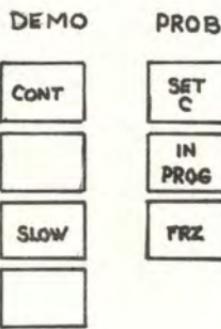

30. Data clear. Normally, data clear will be used at start of flight period, and will clear all stored plots and reset computer time to zero.

31. Ground track erase. Ask console to erase ground track on CRT. This operation will not erase stored plots.

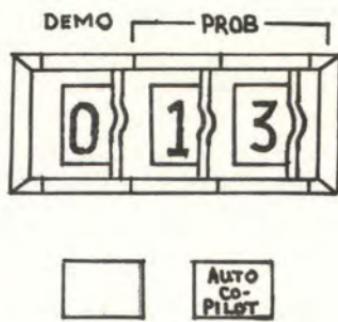

32. Any other problems. Call console; if they cannot help you, they can call maintenance personnel.

PART VI. RECOMMENDED TRAINING SEQUENCE

33. Introduction.

a. General. This training guide supersedes all previous syllabuses for Flight Instructor Training in the Synthetic Flight Training System (2B24).

(1) Purpose of this course: To qualify Instrument Flight Instructors as Flight Instructors in the Synthetic Flight Training System (2B24) to train rated and nonrated students for the awarding of a Standard Instrument Rating and to conduct refresher training for Instrument Rated Aviators.

(2) Location: Fort Rucker, Alabama.

(3) Duration: 1 week, 07:30 hours.

b. Required maneuvers and procedures. Maneuvers and procedures, required for the training, are shown in the recommended logical order of accomplishment. A schedule of flight time is provided for a self-paced program of progress. The schedule is so constructed that adequate time is available for review of previous maneuvers. Ground time should be used to the best advantage in preparation, briefing, and debriefing.

c. General requirements.

(1) Section II (Training Sequence) of this Flight Training Guide will dictate which maneuvers will be taught.

(2) Airspeeds utilized will be maintained within the limits of the appropriate -10 manual for that model aircraft to be flown to include Center/School Directives.

(3) For amplification of the maneuvers/procedures contained herein, consult the Instructor Pilot Information/Operation Guide, TM 1-215, TM 1-225, Rotary Wing Instrument Guide, and appropriate -10 for model being flown.

Amplification of maneuvers and procedures contained herein is not intended to supersede the "standard" pilot's flight

maneuvering and control techniques. The "standard" pilot's flight techniques are those which have been developed and refined over many years of experience and which are considered to be the best available for the particular aircraft and conditions of flight.

Amplification of maneuvers and procedures contained herein is not intended to supersede the "standard" pilot's flight

maneuvering and control techniques.

Amplification of maneuvers and procedures contained herein is not intended to supersede the "standard" pilot's flight techniques.
