Tracking	64
Track Interception	81
VOR Receiver Checks	90
Performance Check	A-1

## PREFACE

This program includes the fundamentals of VHF Omni Navigation enroute procedures. It does not duplicate coverage of general characteristics and VOR airway data discussed in USAAVNS PT's 104, 113, and 119. Completion of those texts prior to this one will be helpful but is not essential for an understanding of enroute procedures.

The scope of the program is limited to Course Indicator displays; it does not include omni display on the Radio Magnetic Indicator (RMI) which can be found in PT 12 and PT 118. USAAVNS PT 121, should be used for instruction related to VOR approaches and terminal procedures.

From this program the student can expect a clear explanation of principles and procedures; but, complete understanding and proficiency will be possible only after application in the synthetic flight trainer and in the aircraft.

## VOR ENROUTE PROCEDURES

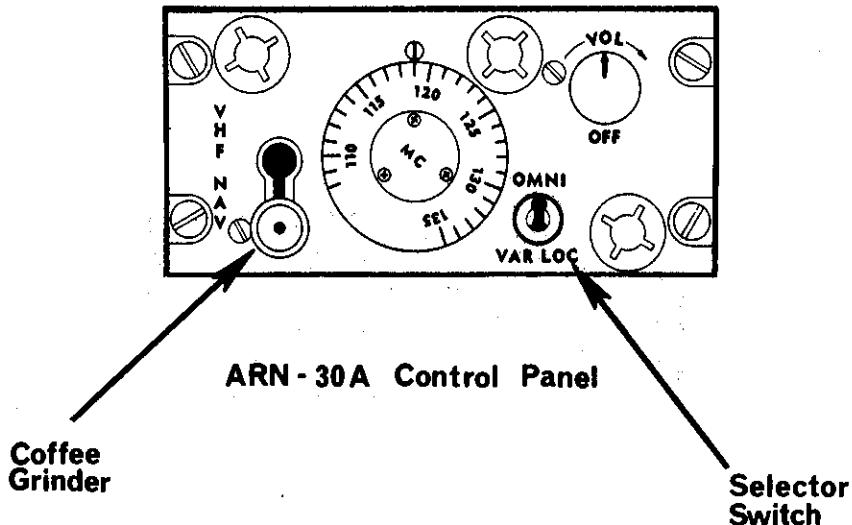

### OBJECTIVES

The student should be able to

1. Tune and identify VOR stations using the ARN 30A, or ARN 30D and E.
2. State the meaning of the warning flag after a station has been tuned.
3. Describe the technique used to signify that a transmitting station is undergoing maintenance and the signal is unreliable.
4. Perform an operational check of VOR equipment.
5. State the permissible errors for ground and airborne checks.
6. Locate and interpret receiver check data in FLIP.
7. Identify station passage.
8. Describe the reaction of the TO-FROM indicator for any given location and course selector setting.
9. For any given course indicator display, chart display, and heading, or a combination of these, identify:
  - a. Location of specified radials/courses.
  - b. Deviation from specified courses/radials.
  - c. Intercept headings in specified cases.
  - d. Tracking corrections in specified cases.
  - e. Position in relation to specified intersections.

VOR or OMNI receivers found in Army aircraft may be of several types. Some Army aircraft are equipped with the ARN 30A which has a "coffee grinder" type frequency selector and a switch for choosing either the OMNI mode or the VAR LOC mode.

Don't worry about the VAR LOC mode at present. If your aircraft is equipped with this type tuning head and you intend to navigate using VOR stations - the selector switch should be placed in the \_\_\_\_\_ position.

Answer: OMNI

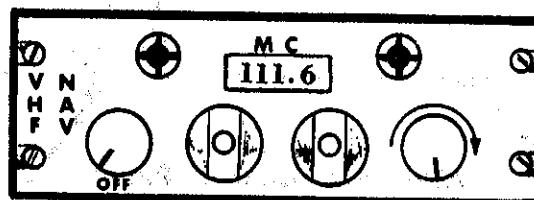

FRAME 2

A second type of VHF NAV (OMNI) receiver you will find in Army aircraft is the ARN 30D (or ARN30E). These have digital tuning which simplifies frequency selection. The left digital knob is used to set-up the whole number part of the frequency and the right knob is used to set-in the decimal part.

Quick and accurate frequency selection is more easily obtained with the

ARN 30A

ARN 30D (or E)

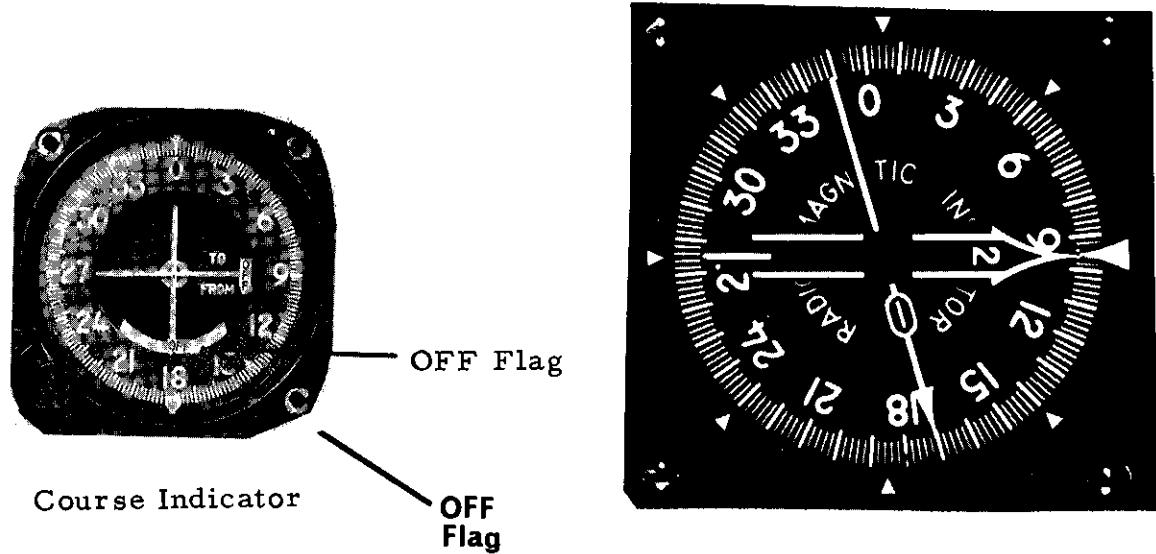

**ARN 30 D or ARN 30 E**

Answer: ✓ ARN 30D (or E)

FRAME 3

Omni navigational signals from the ground station are displayed in the cockpit on either a Radio Magnetic Indicator (RMI) or VOR Course Indicator. Most Army aircraft are equipped with both instruments. This program will be concerned only with the Course Indicator.

The OFF flag at the bottom center of the course indicator is also called a warning flag. It shows if the set is off. Also, when the set is on and a faulty signal is being received the OFF flag will \_\_\_\_\_

Answer: appear (or, be visible)

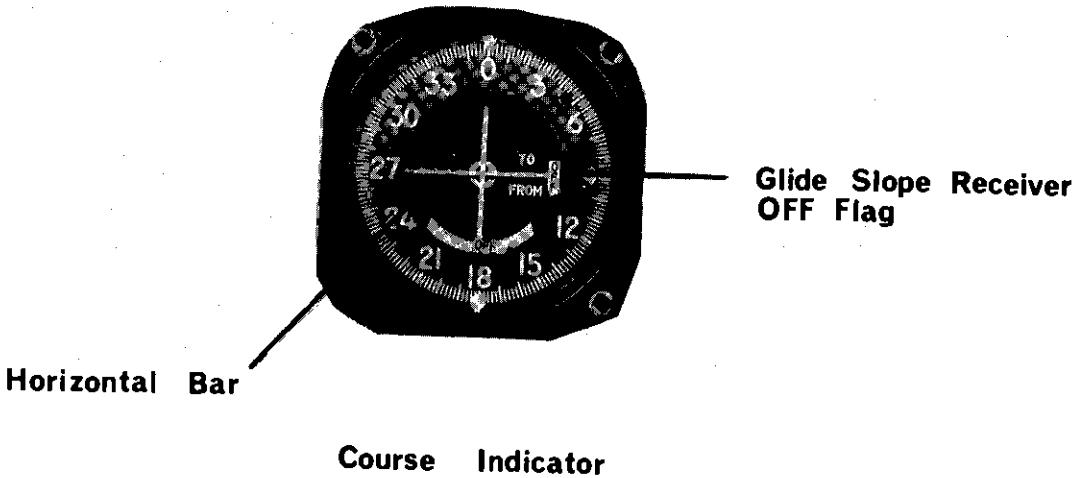

---

#### FRAME 4

The Course Indicator is also used with the Instrument Landing System (ILS). A horizontal bar on the course indicator represents the glide slope of the ILS. An OFF flag at the right side of the indicator shows if the glide slope receiver is working reliably.

The horizontal bar and glide slope OFF flag have absolutely nothing to do with flying with Omni. Therefore, in the remainder of this book, and while flying with omni, you should:

- a. Pay careful attention to the horizontal bar and glide slope OFF flag.
- b. Ignore the horizontal bar and glide slope OFF flag.

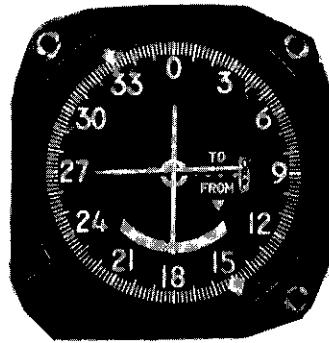

Answer: B. Ignore the horizontal bar and glide slope OFF flag.

---

FRAME 5

After tuning and identifying a station, the pilot looks at the indicator and sees that the off flag at bottom center has disappeared. He knows that the signal being received is \_\_\_\_\_ (reliable/faulty)

In another case the pilot sees the OFF flag after tuning and identifying the station. Even though the station is transmitting a good signal and the pilot has identified the station, the OFF flag means the reception of the signal is \_\_\_\_\_.

This can be caused by: (pick the best answer)

- A. aircraft too low for "line-of-sight" reception from station.
- B. aircraft too far away from station.
- C. either A or B or both.

Answer: reliable  
unreliable  
C. either A or B or both. (too low and/or too far away)

---

FRAME 6

At certain times the omni may transmit a faulty signal. Monitoring equipment will detect faulty signals being transmitted and alert maintenance personnel. If a station is undergoing maintenance but still transmitting, this will be made known to the pilots by removal of the station identification from the transmitting cycle. A pilot knows that an unreliable signal is being transmitted if he is unable to receive the \_\_\_\_\_.

A pilot tunes and identifies a station but sees the OFF flag. This means that a faulty signal is being

- A. transmitted
- B. received

A pilot tunes a station and the OFF flag disappears but he cannot receive the station identification. This means that

- A. his receiver is malfunctioning
- B. an unreliable signal is being transmitted - station undergoing maintenance.

Answer: station identification  
B. received

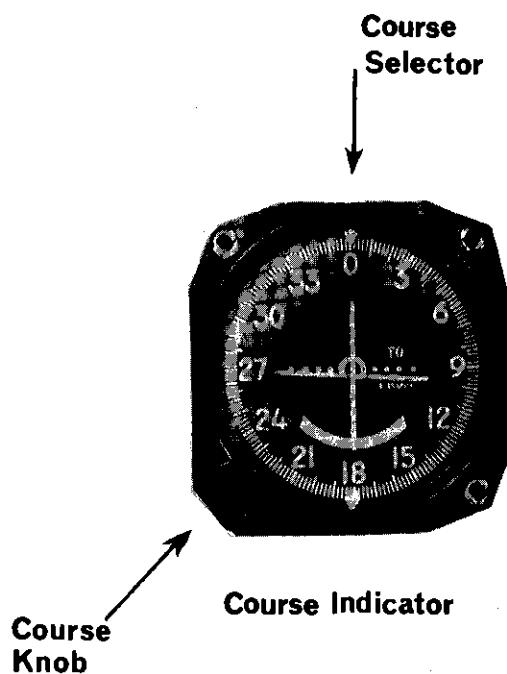

B. unreliable signal being transmitted - station undergoing  
maintenance

---

FRAME 7

Pilots rotate the Course Knob which moves the Course Selector to the desired course. You must set the course selector accurately.

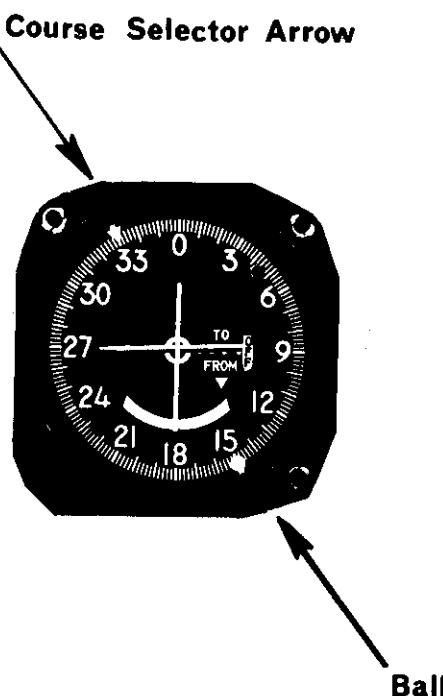

Below the pilot has selected a course of \_\_\_\_\_°

Answer:  $0^{\circ}$  ( $360^{\circ}$ )

FRAME 8

The course selector ball is opposite the course selector arrow on the reciprocal direction. It also moves when the knob is rotated. The course selector is set on \_\_\_\_\_ $^{\circ}$  and the ball is on \_\_\_\_\_ $^{\circ}$ .

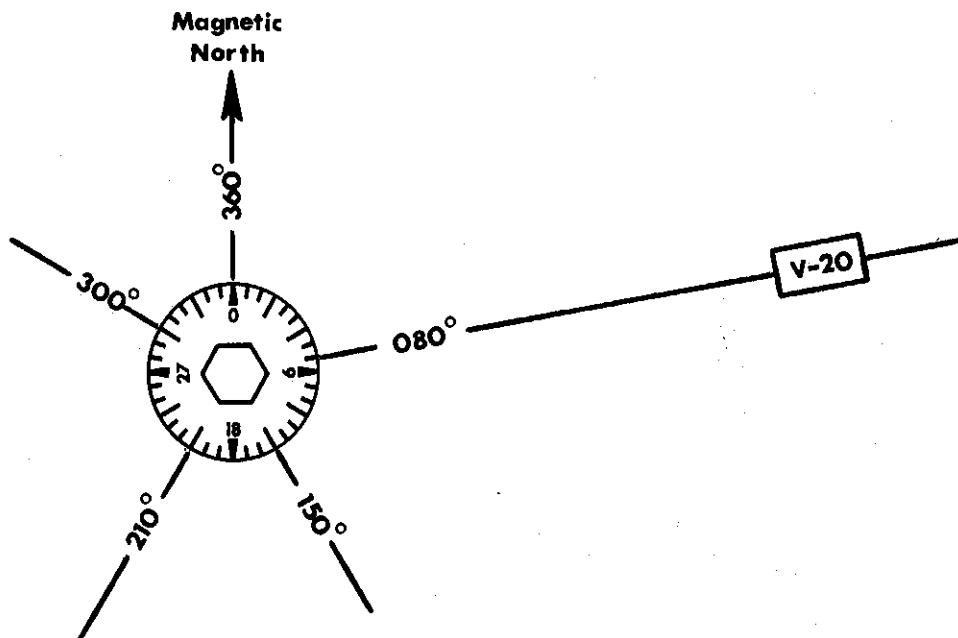

Answers: 330° (arrow)

150° (ball)

---

FRAME 9

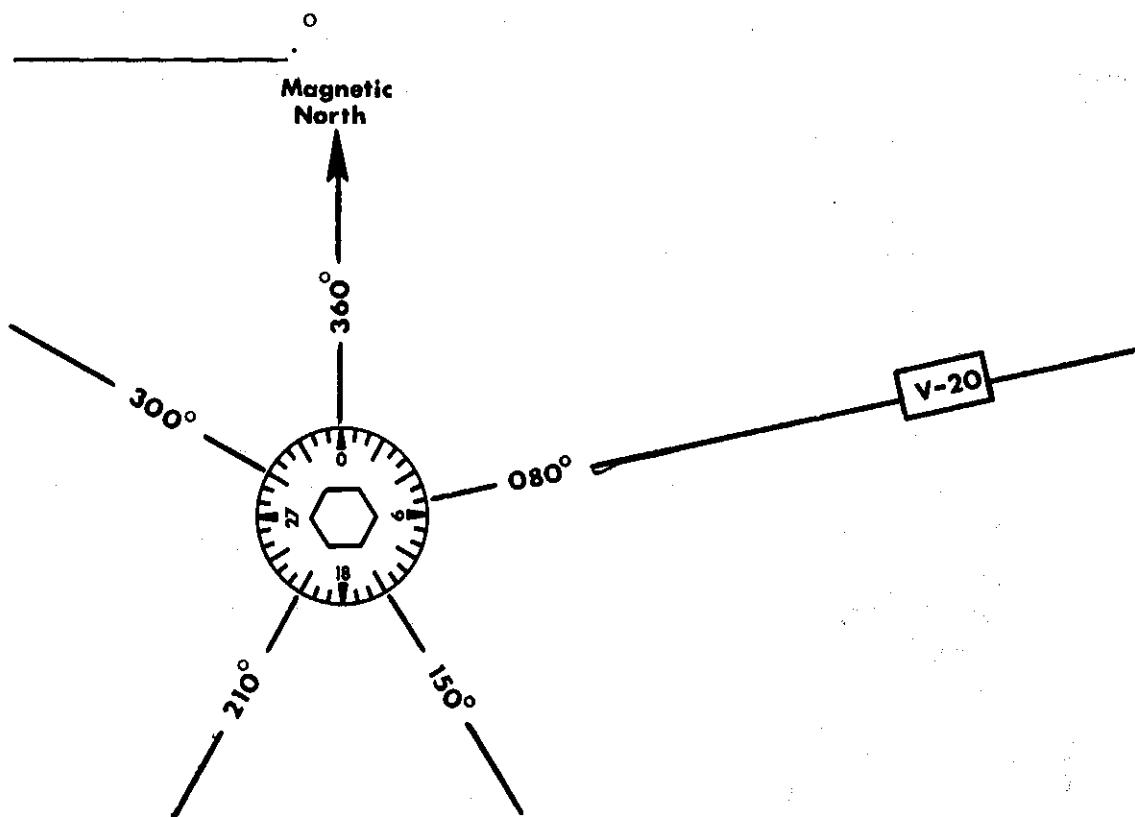

Radio navigation charts similar to the illustration below show omni stations with a compass rose. The station transmits a course line for every degree of the compass - 360 courses. Outbound courses from an omni station are called radials. Although the pilot could fly into or away from the omni station on any one of the 360 radials (depending on his location), certain radials are designated as omni airways. These airways are called victor airways and designated with the letter V and a number. In the illustration, airway \_\_\_\_\_, is made up of the \_\_\_\_\_° radial from the station.

Answer: V-20, 080°

FRAME 10

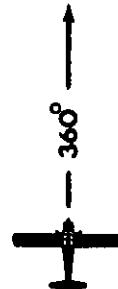

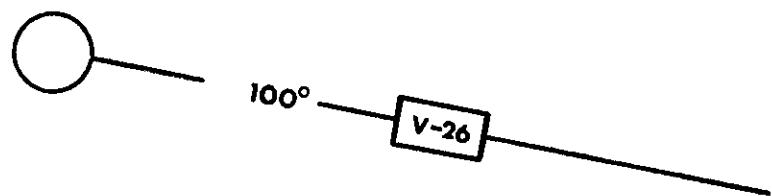

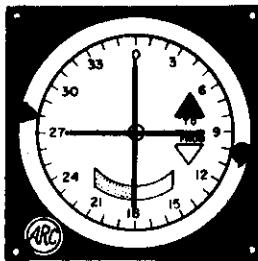

Notice that the 360° radial from the station is aligned with magnetic north and that the radial directions printed on the chart are outbound from the station. If you were near the station on airway V-20 and wished to fly outbound on the airway, you would manually rotate the course knob to set the course selector arrow on \_\_\_\_\_.° But, if you were on airway V-20 some distance away and wished to fly inbound toward the station you would set the course selector arrow on \_\_\_\_\_.°

Answers:  $080^{\circ}$   
 $260^{\circ}$

FRAME 11

Do not confuse the course selector arrow (or ball) with the heading of the aircraft. The course selector arrow and ball will move only when you rotate the knob. You use the course selector to pick the course (radial) you want to fly. But, at the time you set the course selector your actual heading may be anything. In the situation below you are flying toward (approaching) the \_\_\_\_\_° radial. Your heading at the present time is \_\_\_\_\_°. When you reach the airway (V-26) you want to turn toward the station and fly inbound. You should set the course selector on the course you desire to fly inbound, which is \_\_\_\_\_°. At the time you reach the airway you will turn left (inbound) until your heading is also \_\_\_\_\_°

Answers:  $100^{\circ}$  (radial)  
 $360^{\circ}$  (heading)  
 $280^{\circ}$  (inbound - reciprocal of  $100^{\circ}$  radial)  
 $280^{\circ}$  (inbound - heading)

---

FRAME 12

REVIEW

1. Factors which may cause unreliable reception of an omni station are:
  
2. If reception is faulty as a result of one of the factors above, the
  - a. OFF flag will appear
  - b. Identification will not be heard
  
3. The course selector (arrow) setting automatically shows heading of the aircraft. True False.
  
4. The course selected by the pilot is set under the course selector arrow. Its reciprocal appears under the \_\_\_\_\_.
  
5. Omni courses published on charts are called \_\_\_\_\_. They are published as \_\_\_\_\_ (inbound/outbound)
  
6. The orientation of the  $0^{\circ}$  ( $360^{\circ}$ ) outbound omni course is toward \_\_\_\_\_ (true/magnetic) north.
  
7. Omni airways are called \_\_\_\_\_ airways and designated with the letter \_\_\_\_\_.
  
8. Although only certain courses may be published on charts, every omni station produces \_\_\_\_\_ courses which may be used for both inbound and outbound flight.

Note: If you miss a question check the referenced frame

Answers: 1. too low, too far away, receiver malfunction (frame 5)  
2. a. OFF flag will appear (frames 5 & 6)  
3. False (frame 11)  
4. ball (frame 8)  
5. radials, outbound (frame 9)  
6. magnetic (frame 10)  
7. victor, v (frame 9)  
8. 360 (frame 9)

---

### FRAME 13

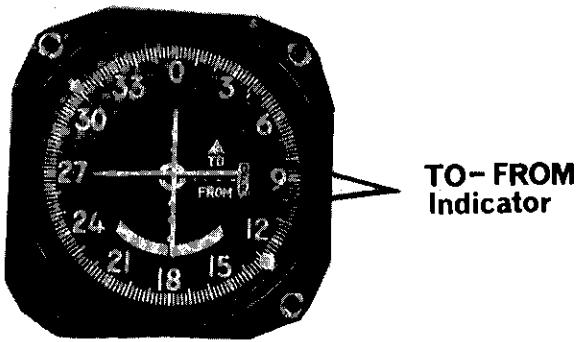

The course indicator includes a sense indicator - more commonly called a TO-FROM indicator.

Every setting of the course selector causes the TO-FROM indicator to show whether the selected course goes toward (TO) or away from (FROM) the station.

The white marker appearing in the TO window below means that the selected course of  $310^{\circ}$  goes toward the station.

The aircraft must be located in some present position such that if the aircraft were to fly the  $310^{\circ}$  course it would be going toward the station. The present location of the aircraft must be:

- A. southeast of the station.
- B. northwest of the station.

Aircraft  
Here???

Aircraft  
Here???

Answer: A. Southeast of station

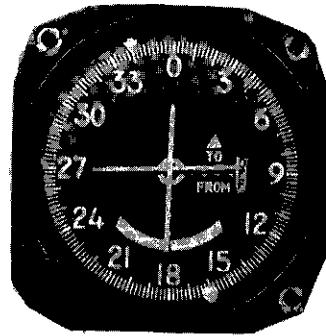

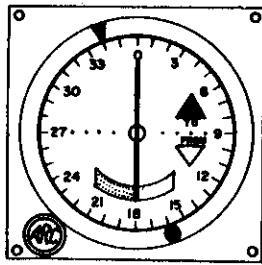

FRAME 14

This program may represent the course indicator with an actual photograph or a line drawing. On actual photographs the indications are white on a black face. On line drawings the indications are black on a white face.

Which statement is correct?

The photo shows that  $340^{\circ}$  goes TO the station and the line drawing shows that  $340^{\circ}$  goes FROM the station.

Both instruments show that  $340^{\circ}$  goes TO the station.

Answer:  both instruments show that  $340^{\circ}$  goes TO the station.

---

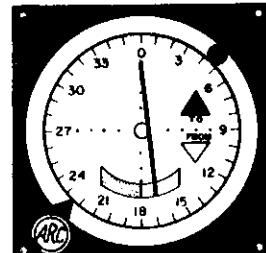

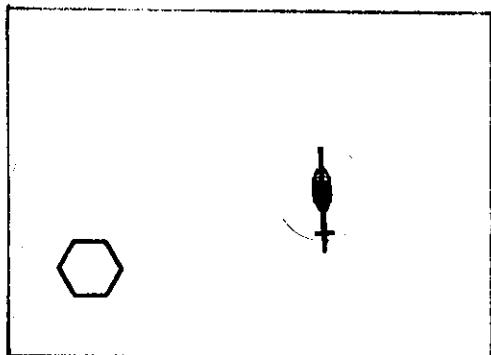

FRAME 15

The TO-FROM indicator does not tell you anything about the actual heading of the aircraft. In the case below the pilot has selected a course of  $225^{\circ}$  and since his present location is northeast of the station, the  $225^{\circ}$  course would take him TO the station. Therefore, the TO-FROM indicator shows TO.

Notice that the aircraft has not yet turned to a heading of  $225^{\circ}$ . Actually the present heading of the aircraft is taking it further away from the station. But, the TO-FROM indicator says: "If you fly the course that you have selected, it will take you closer TO the station."

Suppose the pilot rotates the course knob and selects another course - for example:  $090^{\circ}$ . As soon as he sets the course arrow on  $090^{\circ}$  the TO-FROM indicator will react by saying: "If you fly a course of  $090^{\circ}$  from your present location, it will take you:

- A. further away FROM THE STATION
- B. closer TO the station

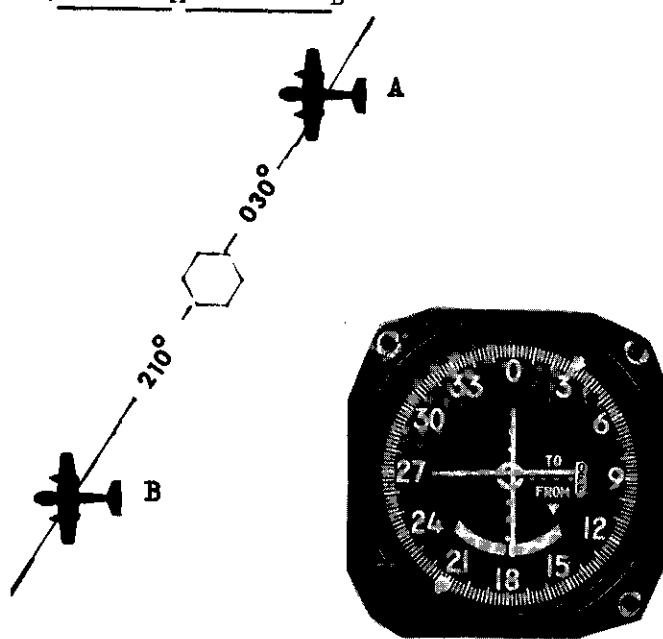

Answer: A. further away FROM the station

---

FRAME 16

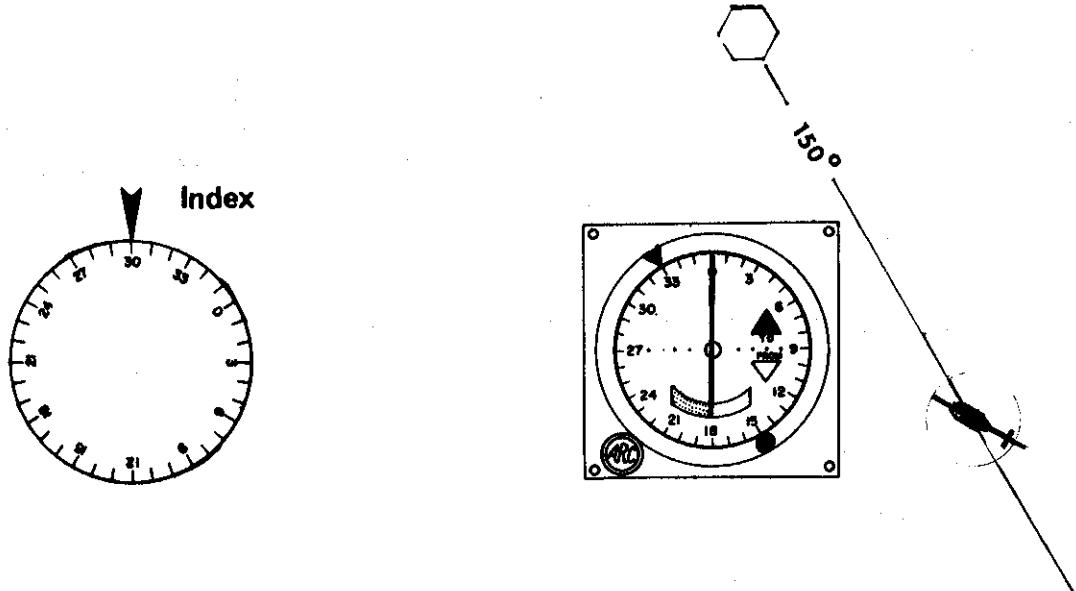

The illustration below shows that the selected course of  $030^{\circ}$  (if flown) will take the aircraft further away FROM the station. The course indicator does NOT give any indication of the actual heading of the aircraft. This course indicator corresponds to the aircraft at position:       A      B      

Answer: A.

FRAME 17

There are several kinds of primary heading indicators; the magnetic compass is a back-up, or secondary heading indicator. To show headings in this program we will use a rotating compass card with heading shown under the index. The instruments below show that from the present location of the aircraft, the course TO the station is \_\_\_\_\_°. But the aircraft is flying a heading of \_\_\_\_\_°. In order to fly to the station, the pilot should turn \_\_\_\_\_ (left/right) to a heading of \_\_\_\_\_°.

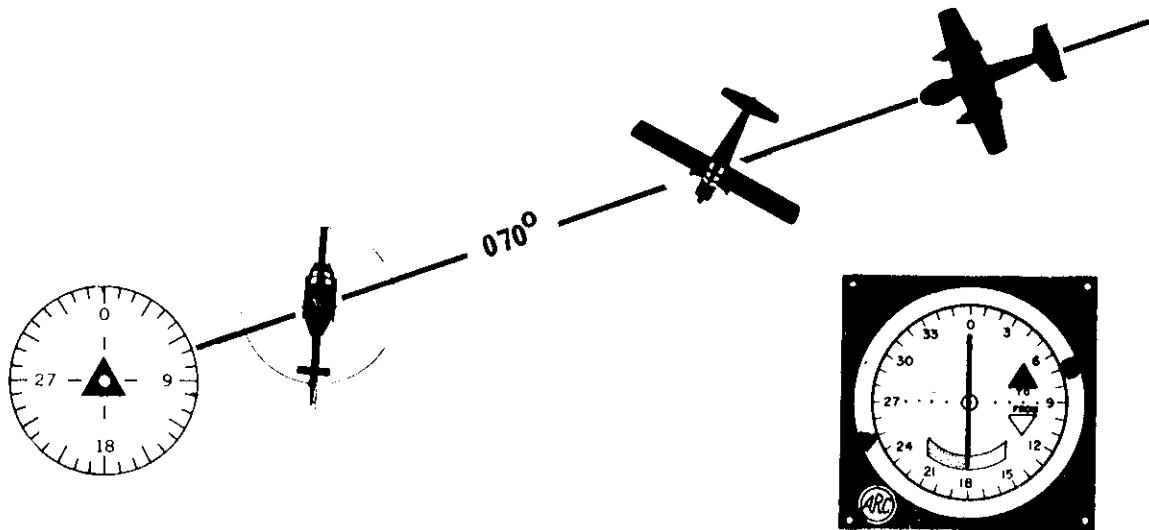

Answer:  $330^{\circ}$ ,  $300^{\circ}$ , right,  $330^{\circ}$

---

FRAME 18

The three aircraft below are located on the  $070^{\circ}$  radial although each is on a different heading. Each pilot has the course selector set on  $250^{\circ}$  and in each aircraft the TO-FROM shows TO because if the aircraft actually flew the selected course of  $250^{\circ}$ , it would take them TO the station.

The reaction of the TO-FROM (sense) indicator depends only on the course which is set on the course selector and

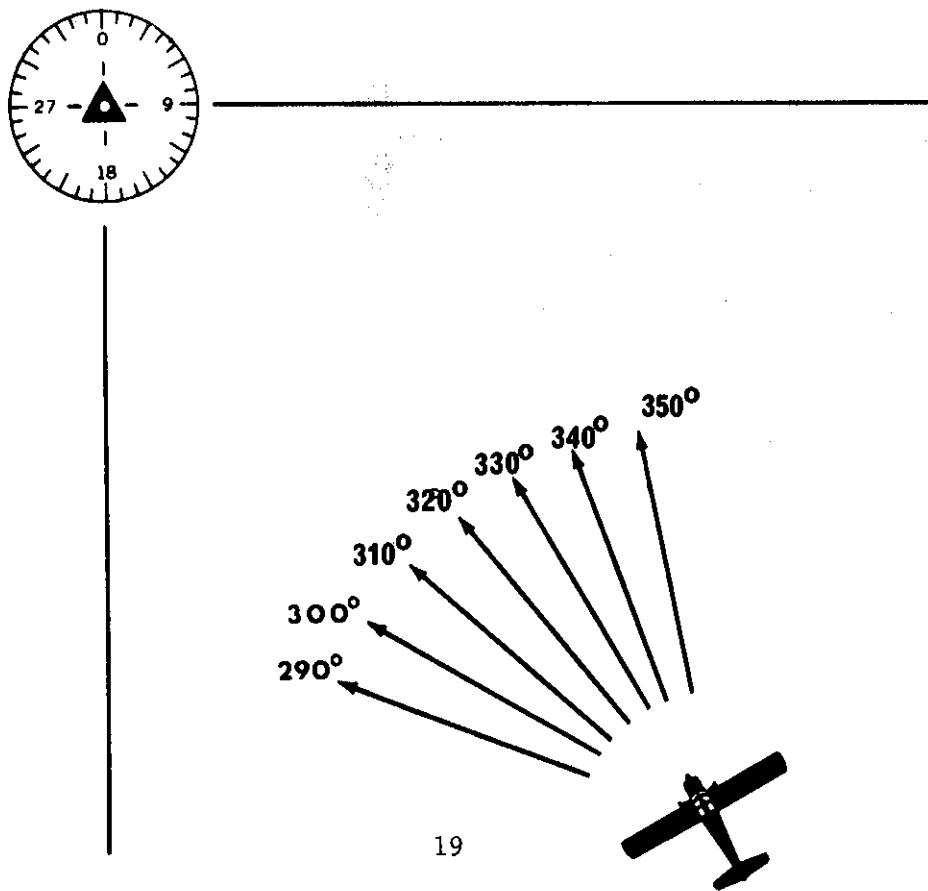

- A. the location of the aircraft with respect to the station.
- B. the heading of the aircraft.
- C. the location of the aircraft and its heading.

Answer: A. the location of the aircraft with respect to the station.

FRAME 19

Assume an aircraft is located generally in the southeast quadrant of a station. There are many different courses which would take the aircraft closer TO the station although there is only one which goes exactly to the station.

The TO-FROM indicator must always react to the selected course. If any of the courses shown below are selected the sense indicator will react by showing \_\_\_\_\_ (TO/FROM).

Answer: TO

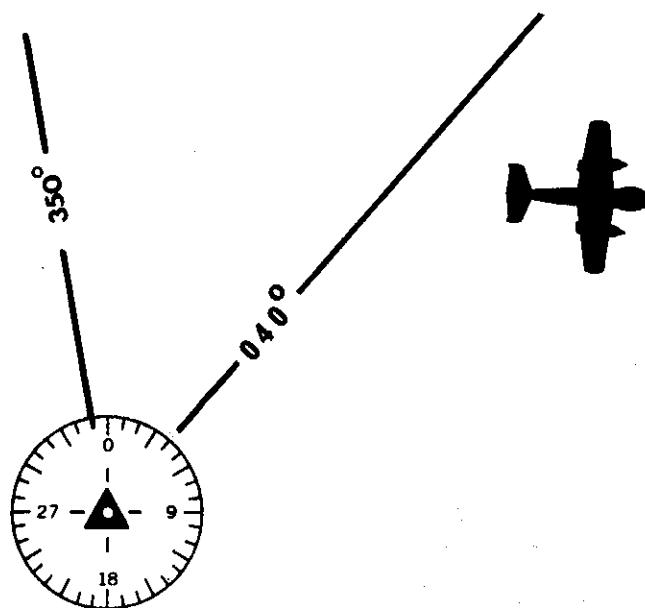

FRAME 20

The aircraft below is not exactly on the  $040^{\circ}$  radial - and his heading is not  $040^{\circ}$ .

But if the aircraft flew a course of  $040^{\circ}$  from its present position, it would be going from the station so, the TO-FROM indicator shows FROM when the course selector is set on  $040^{\circ}$ .

If the pilot were to set the course selector on  $350^{\circ}$ , the TO-FROM indicator would show \_\_\_\_\_, because if the aircraft turned and flew  $350^{\circ}$  (from its present position) it would be

- A. getting closer TO the station.
- B. getting further away FROM the station.

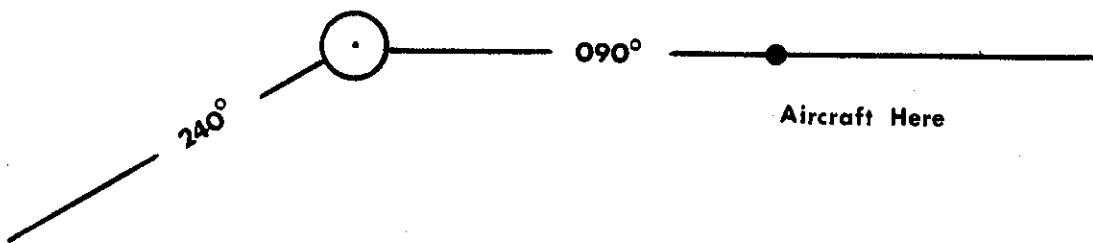

Answer: FROM

B.

---

Frame 21

An aircraft is located on the  $090^{\circ}$  radial and the pilot sets the course selector arrow on  $240^{\circ}$ . What will the TO-FROM indicator show? \_\_\_\_\_.

Answer: TO

---

FRAME 22

At many airway VOR stations, the pilot must make a position report or take a time check to compute ground speeds and revise estimates.

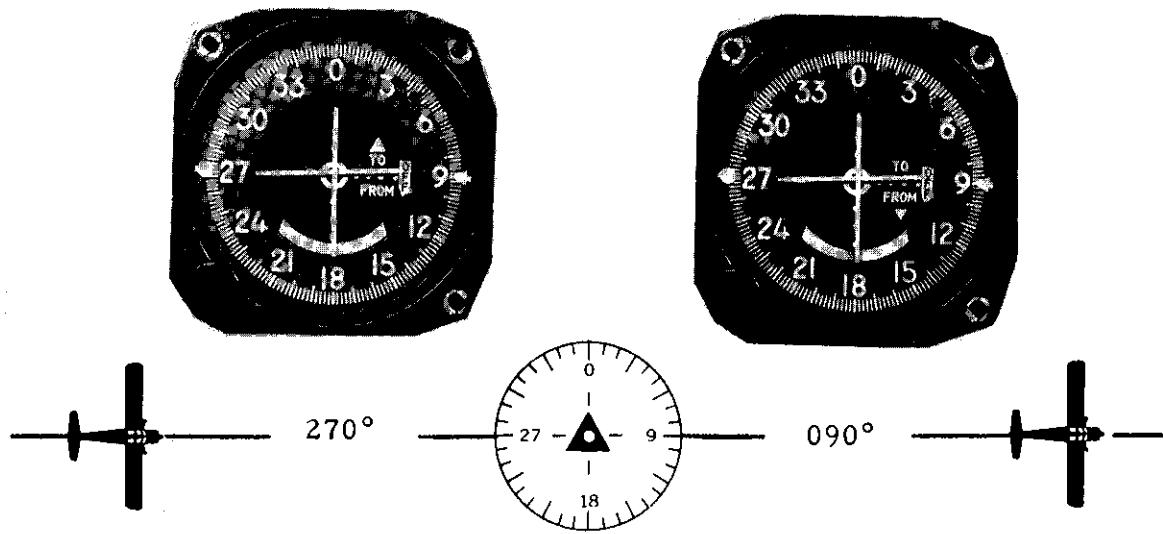

As the aircraft flew over the station below from point A to point B, was it necessary to change the course selector setting? Yes No

What happened to the TO-FROM indicator? \_\_\_\_\_

\_\_\_\_\_.

If the aircraft were in the clouds under actual instrument conditions, how would the pilot know exactly when he passed the station? \_\_\_\_\_

\_\_\_\_\_.

A

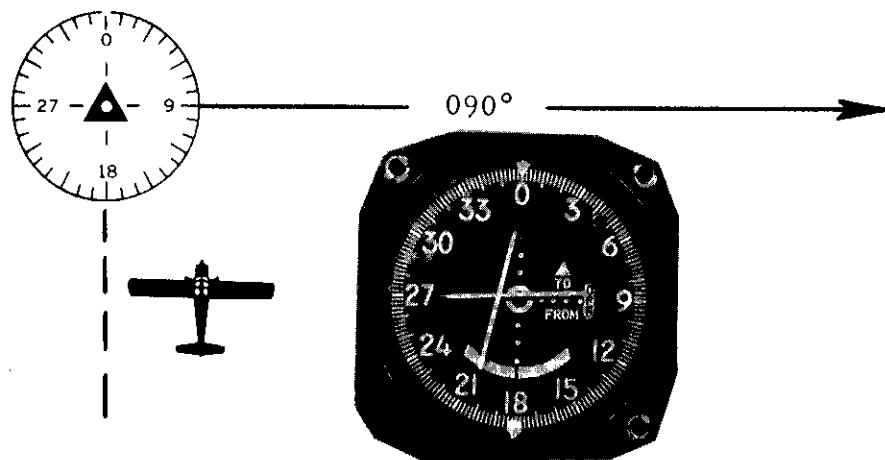

B

Answer:  No,

changed from TO, to FROM  
when the TO-FROM indicator reverses.

FRAME 23

Although the aircraft below will not fly over the station, at what point will the TO-FROM indicator reverse? \_\_\_\_\_

Answer: When the aircraft crosses the  $090^{\circ}$  radial, abeam the station.

---

FRAME 24

REVIEW

1. The sense indicator will show TO or FROM depending on (check each item as Yes or No)
  - A. the course set up with the course selector.
  - B. the heading of the aircraft
  - C. the location of the aircraft and station
2. After a station has been tuned using the correct frequency, the OFF flag (warning flag) appears. What does this indicate?

---

3. A pilot is unable to receive station identification even though the course indicator is reacting to a signal. What does this mean?

---

4. For each situation below showing location of aircraft with respect to the station, and the course set under the course selector arrow, write in the reaction of the TO-FROM indicator.

<u>Aircraft Location</u>	<u>Selected Course</u>	<u>TO-FROM</u>
Northeast	$090^{\circ}$	_____
Northwest	$180^{\circ}$	_____
Southwest	$270^{\circ}$	_____
Southeast	$300^{\circ}$	_____

1. A. Yes, B. No, C. Yes  
Answers: 2. Faulty signal being received  
3. Unreliable signal being transmitted  
4. FROM, TO, FROM, TO

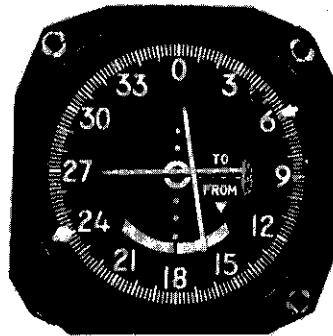

FRAME 25

The vertical needle of the course indicator - also called the deviation indicator is pivoted at the top and swings right and left to show that the course is right or left, or an "on course" position.

The needle represents the course set under the course selector arrow and shows if the aircraft is flying that course. When the needle swings to the right it means that the course is to the pilot's right and he must turn right to get back on course.

Match the A,B,C indicators below with the aircraft numbered 1, 2, 3.

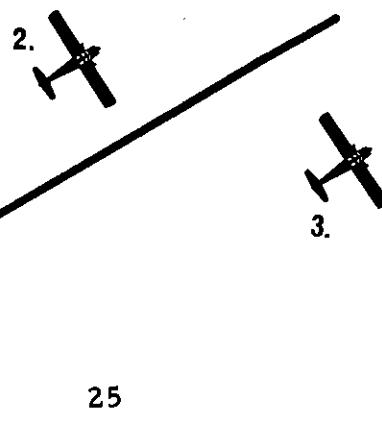

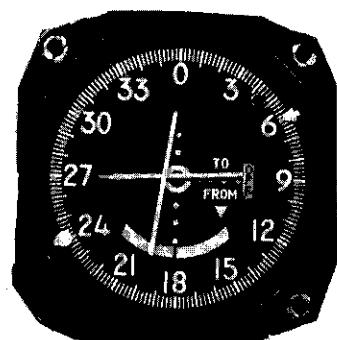

A

B

C

1. \_\_\_\_\_  
2. \_\_\_\_\_  
3. \_\_\_\_\_

Answers: 1. B  
2. A  
3. C

---

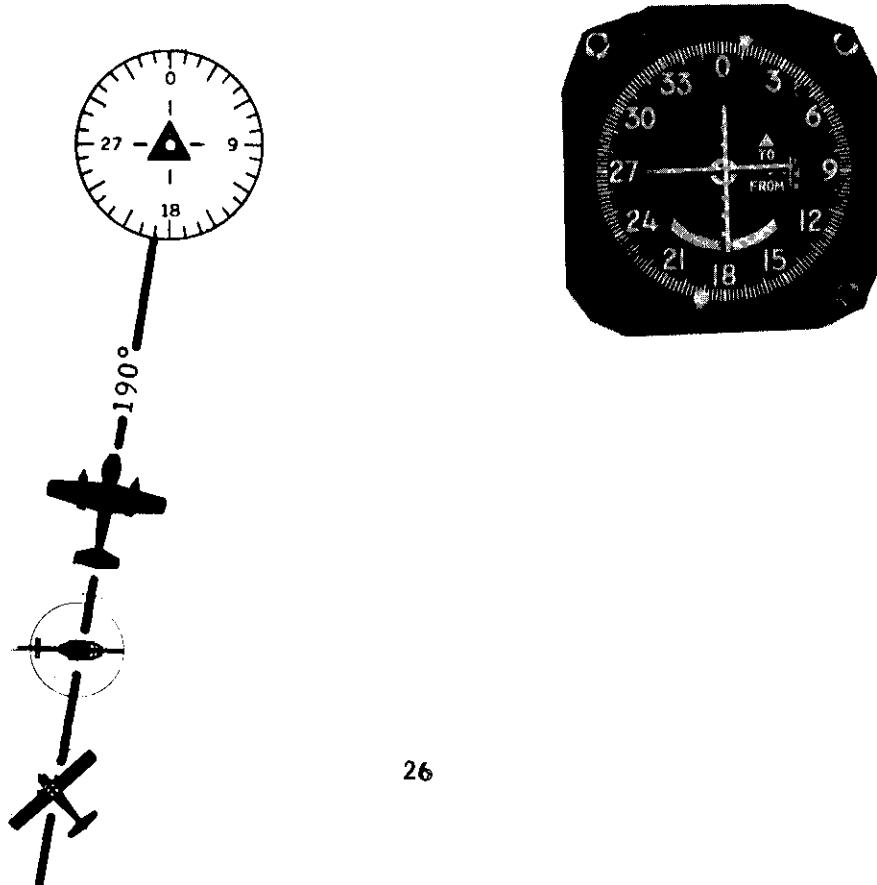

FRAME 26

When the deviation indicator is centered the aircraft is on the course which is set under the course selector arrow.

As shown earlier, the indications on the course indicator do not depend on the heading of the aircraft at a particular time.

The course indicator below represents what each pilot would see in the aircraft shown.

In each case the pilot knows that the course to the station is       ° and that he is located on the       ° radial.

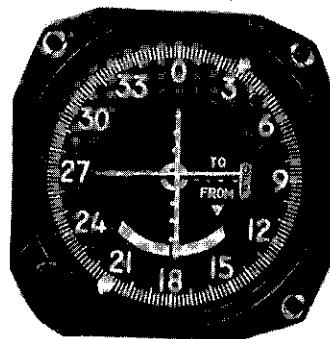

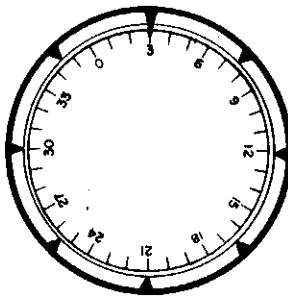

Answer:  $010^{\circ}$ ,  $190^{\circ}$

FRAME 27

You may refer to a course as going to or from a station. But, radials are always from a station and are printed on charts as such.

The course selector "ball" is exactly opposite the course selector arrow and therefore shows the reciprocal of the course under the arrow.

A pilot orients himself by looking at the TO-FROM, the needle, and the course selector arrow and ball. Inspect the course selector and answer the questions below.

1. The course set under the course selector arrow is \_\_\_\_°.
2. The selected course goes \_\_\_\_\_ (TO/FROM) the station.
3. The course to the station is \_\_\_\_°.
4. Is the aircraft on the selected course? \_\_\_\_ Yes \_\_\_\_ No.
5. On what radial is the aircraft? \_\_\_\_°
6. Does the heading indicator show the aircraft flying the selected course? \_\_\_\_ Yes \_\_\_\_ No
7. The station is approximately south southwest of the aircraft. \_\_\_\_ Yes \_\_\_\_ No

Answer: 1.  $030^{\circ}$  5.  $030^{\circ}$   
2. FROM 6. Yes  
3.  $210^{\circ}$  7. Yes  
4. Yes

---

FRAME 28

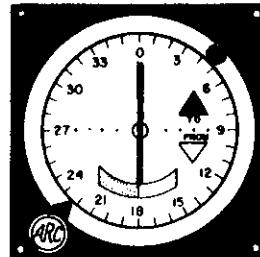

If you are flying in the vicinity of an omni station and need to orient yourself with respect to the station follow these steps.

1. Tune and identify the station.
2. Rotate the course selector knob until the needle is centered and the TO-FROM shows TO.
3. Then read -
  - course TO the station under the course selector arrow.
  - radial FROM the station under the ball.

Example: Assume the station has been properly tuned and identified.

The course indicator shows:

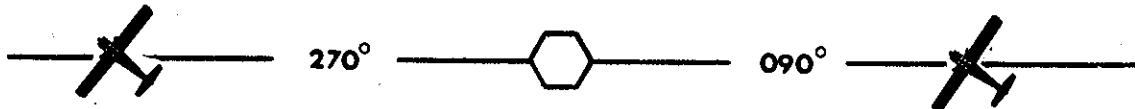

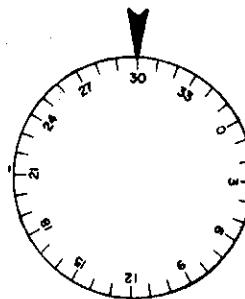

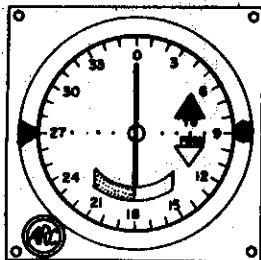

1. Course TO station is \_\_\_\_\_ $^{\circ}$
2. Radial FROM station is \_\_\_\_\_ $^{\circ}$
3. Aircraft is:
  - A. northeast of station
  - B. southwest of station

**Answers:** 1.  $225^{\circ}$   
2.  $045^{\circ}$   
3. A. Northeast

FRAME 29

1. In the situation below, the course to the station is \_\_\_\_\_ $^{\circ}$ ; the aircraft is on the \_\_\_\_\_ $^{\circ}$ radial.
2. If the pilot holds his present heading, will he fly off the radial he is now on? \_\_\_\_\_ Yes \_\_\_\_\_ No (calm winds)
3. To stay on the radial and fly to the station, the pilot needs to turn \_\_\_\_\_ (left/right) to a heading of \_\_\_\_\_ $^{\circ}$ .

Here ??

Here ??

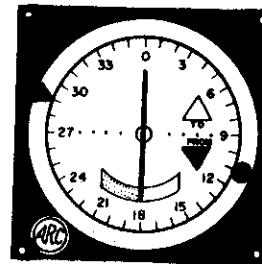

Answer: 1.  $270^{\circ}$ ,  $090^{\circ}$   
2. Yes  
3. left,  $270^{\circ}$

---

FRAME 30

You may also orient yourself with respect to the station by rotating the course selector knob until the needle centers and the sense indicator shows FROM. In that case, the course from the station (the radial) is read under the course selector arrow and its reciprocal appearing under the ball is the course to the station.

1. In this case the radial (course from station) is       °?
2. The course to the station is       °
3. The aircraft is:
  - A. east southeast of the station.
  - B. west northwest of the station.

Answers: 1.  $290^{\circ}$   
2. 110  
3. B. West northwest

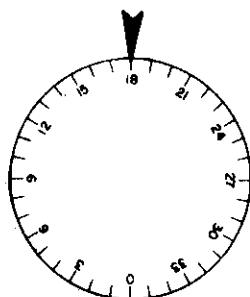

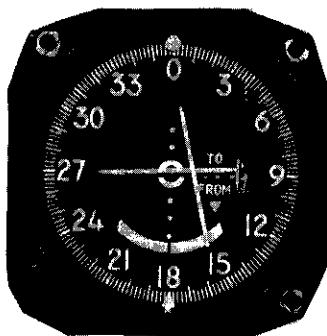

---

FRAME 31

You may need to orient yourself with respect to a given course or radial.

Assume you want to fly away from the station on the  $180^{\circ}$  radial. After turning to a heading of 180, tuning the station, and setting the course selector to the desired course of  $180^{\circ}$ , you see that you are not on course since the needle is not centered.

The needle is to the \_\_\_\_\_, which means that the desired course is also to the \_\_\_\_\_. The aircraft is \_\_\_\_\_ (east/west) of the course.

$180^{\circ}$

Is The  
Aircraft  
Here  
??

Is The  
Aircraft  
Here  
??

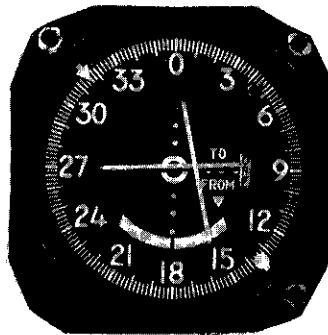

Answer: right, right, east

FRAME 32

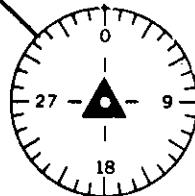

Don't forget that the course indicator is not sensitive to your aircraft heading at a particular time. It is sensitive to your location and the selected course.

In the case below the needle is to the right. This does not mean the selected course is to the pilot's right because the aircraft heading does not agree with the selected course.

Assume the pilot turned and rolled out on a heading of  $315^\circ$ . Now, the aircraft heading agrees with the selected course; the needle deflected to the right means the desired (selected) course is \_\_\_\_\_.

$315^\circ$

Answer: right

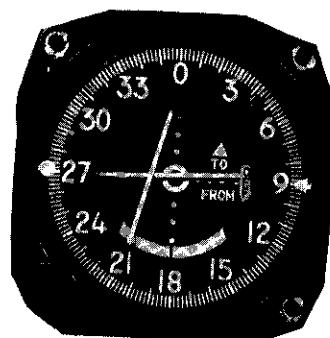

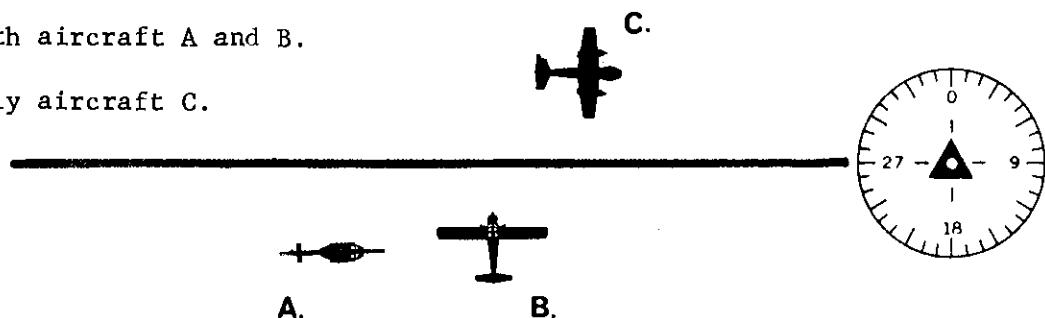

FRAME 33

Even though the aircraft heading does not agree with the selected course, the pilot can imagine that it does. He can look at the selected course and the deflection of the needle and say:

"If I were flying that course it would be to my...."

The course indicator shown below may represent one or more of the aircraft shown. Inspect the illustration and mark the correct statement. The diagram represents

- A. only aircraft A.
- B. only aircraft B.
- C. both aircraft A and B.
- D. only aircraft C.

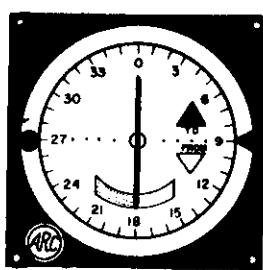

Answers: C. Both aircraft A and B

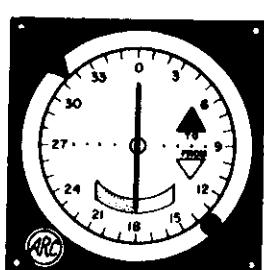

FRAME 34

Match the course indicators (A,B,C, and D) with the corresponding aircraft locations.

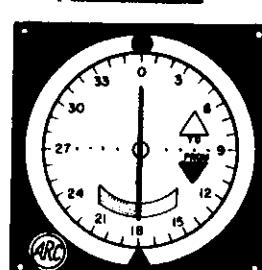

A. \_\_\_\_\_

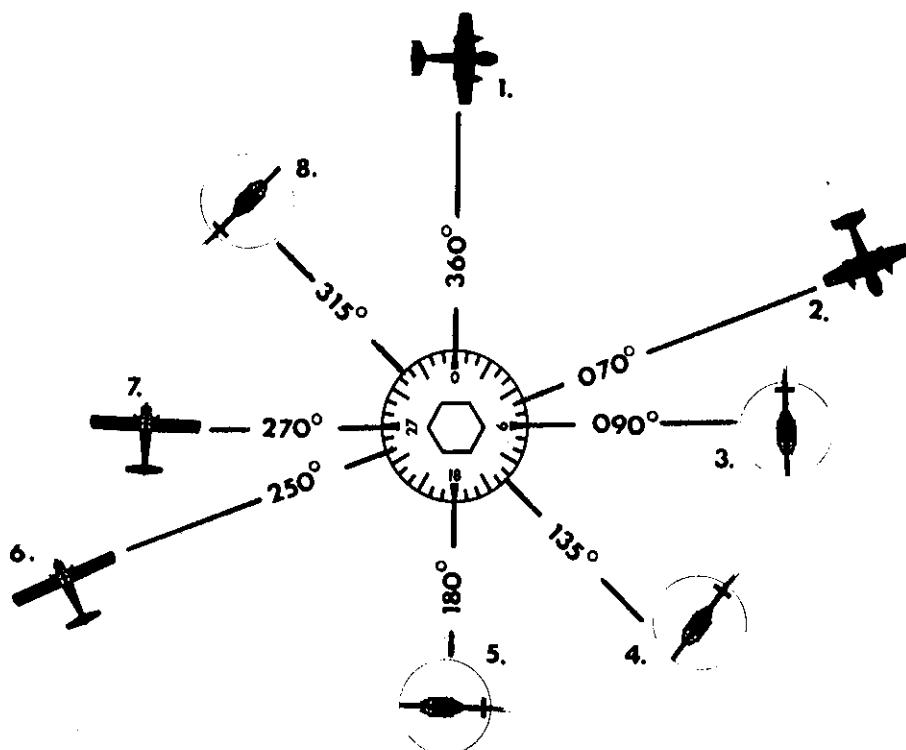

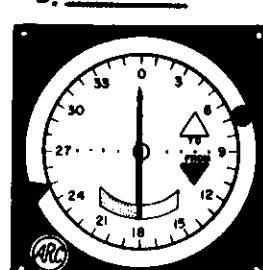

B. \_\_\_\_\_

C. \_\_\_\_\_

D. \_\_\_\_\_

Answers: A. 7  
B. 4  
C. 5  
D. 6

FRAME 35

REVIEW

1. With the station properly tuned and identified, the vertical

needle centered, and the sense indicator showing TO, the radial on  
which the aircraft is located appears under the course selector  
Arrow (arrow/ball)

2. An aircraft is flying parallel to its intended course with the  
course selector set properly. The vertical needle is deflected left;  
this means:

A. the aircraft is left of the course

B. the course is left of the aircraft

3. An aircraft is exactly southwest of an omni station and the pilot  
desires to fly inbound to the station. How should the course indicator  
settings and indications appear?

	<u>Course Selector Arrow</u>	<u>Course Selector Ball</u>	<u>Sense Indicator</u>	<u>Needle</u>
A.	045	225	FROM	Centered
B.	225	045	TO	Centered
C.	225	045	FROM	Centered
D.	045	225	TO	Centered

Answers: 1. ball  
2. B. course is left of aircraft  
3. D.

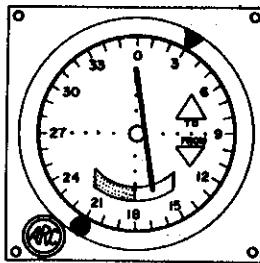

FRAME 36

The center circle on the course indicator - often called the "doughnut" has a row of horizontal dots to the right and left.

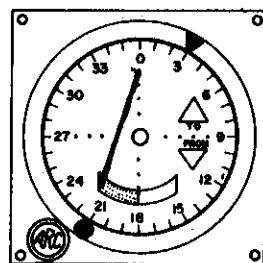

The edge of the doughnut and the dots represent the number of degrees between the position of the aircraft and the selected course. The edge of the doughnut represents  $2^{\circ}$  off and each successive dot is 2 additional degrees. "A" below shows the course as  $2^{\circ}$  right, B shows the course as  $4^{\circ}$  left.

C below shows the course as \_\_\_\_\_ $^{\circ}$  \_\_\_\_\_ (left/right).

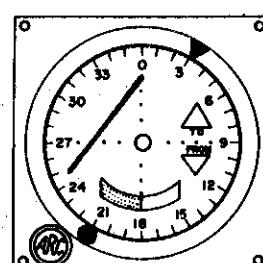

The indicator is capable of showing a maximum of \_\_\_\_\_ $^{\circ}$  right or left.

A

B

C

Answer:  $8^{\circ}$ , left  
 $10^{\circ}$

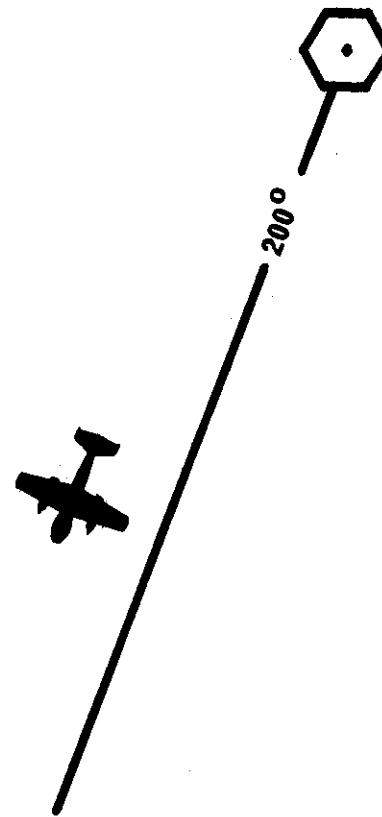

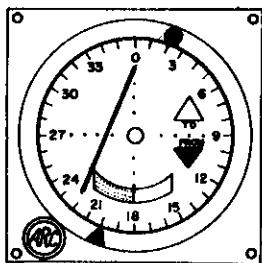

---

FRAME 37

In the situation below the aircraft is not exactly on the  $200^{\circ}$  radial. The deviation needle is deflected \_\_\_\_\_ $^{\circ}$  to the left which means that the  $200^{\circ}$  radial is \_\_\_\_\_ $^{\circ}$  left.

NOTE: The aircraft is flying parallel to the  $200^{\circ}$  radial holding a heading of  $200^{\circ}$ .

What radial is the aircraft on? \_\_\_\_\_.

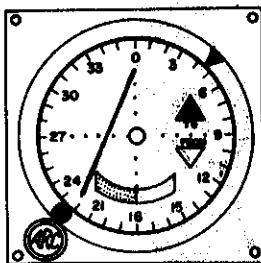

Answers:  $5^{\circ}$ ,  $5^{\circ}$   
 $205^{\circ}$  radial

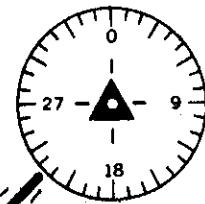

FRAME 38

The aircraft below are off the desired course of  $045^{\circ}$  inbound. However, they are in different positions and the course indicator shown is correct for only one of the aircraft. Which aircraft matches the course indicator?

A       B       C

A

B

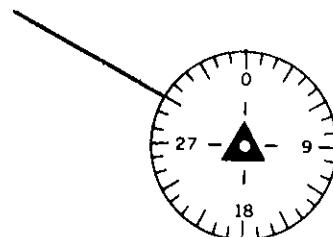

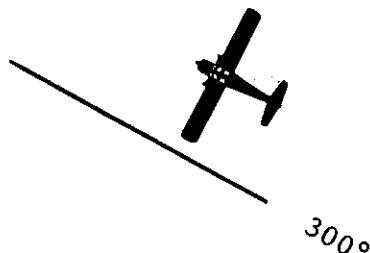

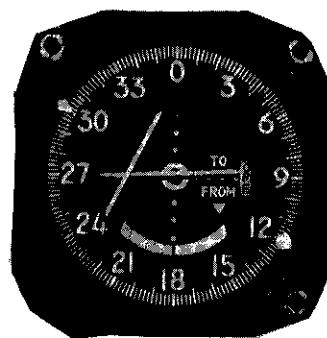

C

Answers: ✓ B

FRAME 39

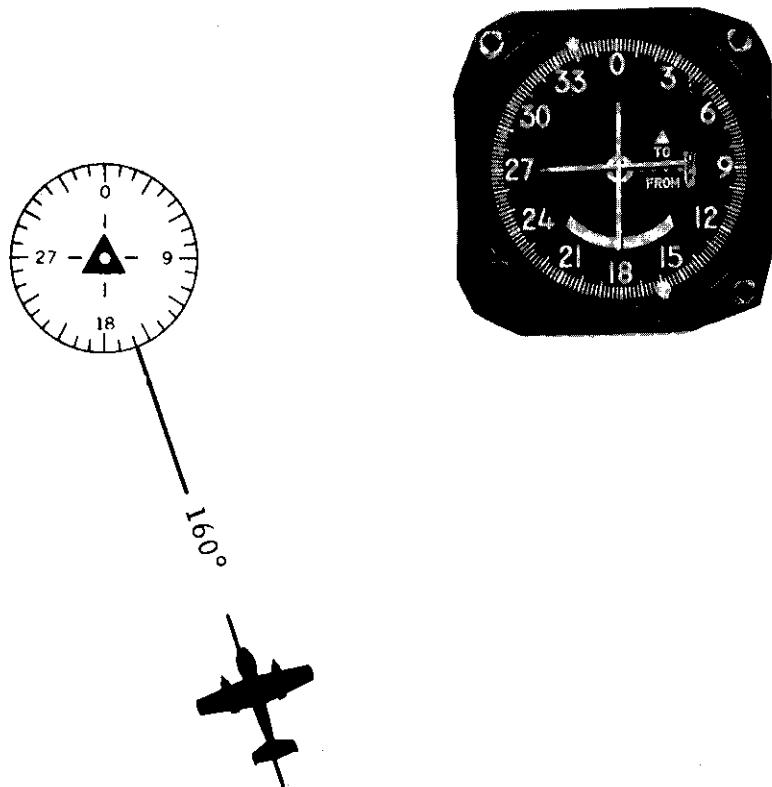

The instruments show that the  $300^{\circ}$  radial is  $8^{\circ}$  to the left of the aircraft; therefore, the aircraft must be located on the \_\_\_\_\_ $^{\circ}$  radial.

Answers:  $308^{\circ}$

FRAME 40

The aircraft is inbound on a course of  $340^{\circ}$ , or the ball shows that the aircraft is on the \_\_\_\_\_  $^{\circ}$  radial. If the course selector is rotated to  $350^{\circ}$  (ball on  $170^{\circ}$ ), the needle would swing to the \_\_\_\_\_, because the  $350^{\circ}$  inbound course ( $170^{\circ}$  radial) is to the \_\_\_\_\_ of the present position of the aircraft.

Answers:  $160^{\circ}$ , left, left.

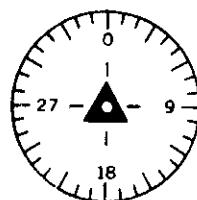

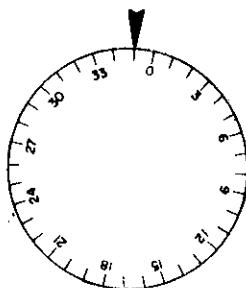

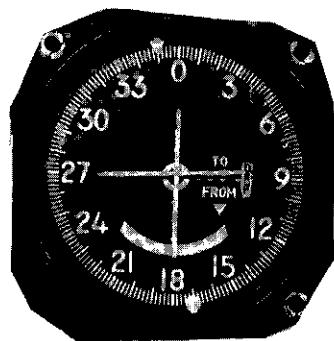

---

FRAME 41

The aircraft is located on the \_\_\_\_\_ $^{\circ}$  radial and is flying a heading of \_\_\_\_\_ $^{\circ}$ .

The  $330^{\circ}$  radial is \_\_\_\_\_ $^{\circ}$  to the \_\_\_\_\_ (left - right) of the aircraft.

(sketch in the radials from the station if you need to)

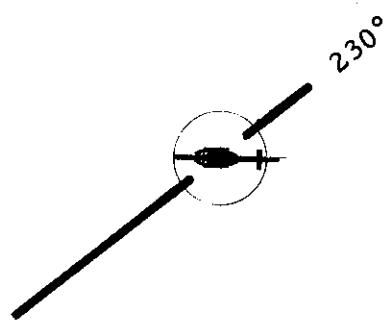

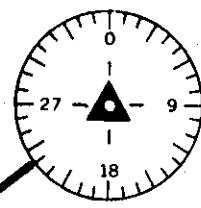

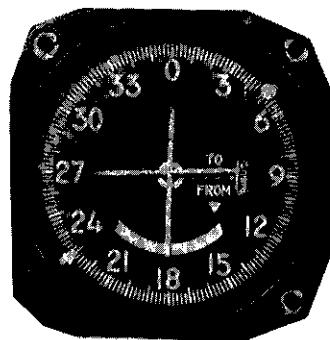

Answers:  $350^\circ$ ,  $350^\circ$ ,  
 $20^\circ$ , left

---

FRAME 42

The aircraft is on the  $230^\circ$  radial but flying a heading of  $270^\circ$ .  
If the aircraft holds the  $270^\circ$  heading, the deviation needle will  
swing to the \_\_\_\_\_.

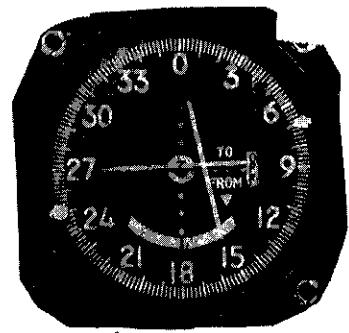

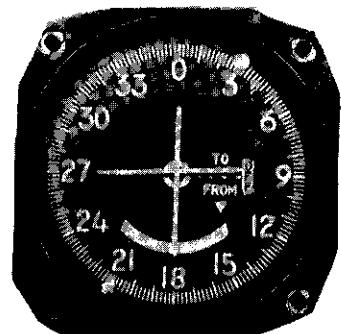

Answer: left

---

ORIENTATION - REVIEW

FRAME 43

1. The instrument shows that the aircraft is
  - A. south southwest of station on  $030^{\circ}$  radial.
  - B. north northeast of station on  $210^{\circ}$  radial.
  - C. south southeast of station on  $210^{\circ}$  radial.
  - D. north northeast of station on  $30^{\circ}$  radial.
  
2. The instrument shows that
  - A. the aircraft is  $4^{\circ}$  right of the  $070^{\circ}$  radial.  
(aircraft on  $74^{\circ}$  radial)
  - B. the  $070^{\circ}$  radial is  $4^{\circ}$  right of the aircraft.  
(aircraft on  $66^{\circ}$  radial)
  - C. the aircraft must turn  $4^{\circ}$  left to make the needle center.
  - D. the station is approximately east northeast of the aircraft

Answers: 1. C

2. B

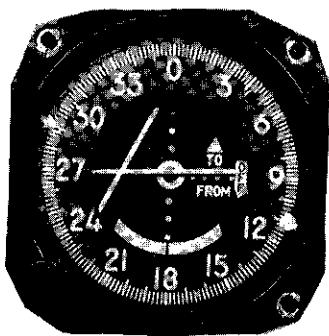

---

ORIENTATION - REVIEW

FRAME 44

1. The instrument shows that the aircraft is approximately  $8^{\circ}$

- A. north of the  $290^{\circ}$  radial
- B. south of the  $290^{\circ}$  radial
- C. north of the  $110^{\circ}$  radial
- D. south of the  $110^{\circ}$  radial

2. The instrument shows that the aircraft is on the

- A.  $180^{\circ}$  radial north of the station
- B.  $180^{\circ}$  radial south of the station
- C.  $360^{\circ}$  radial north of the station
- D.  $360^{\circ}$  radial south of the station
